100350 Low Power Hex D-Type Latch

General Description

The 100350 contains six D-type latches with true and complement outputs, a pair of common Enables (\bar{E}_a and \bar{E}_b), and a common Master Reset (MR). A Q output follows its D input when both \bar{E}_a and \bar{E}_b are LOW. When either \bar{E}_a or \bar{E}_b (or both) are HIGH, a latch stores the last valid data present on its D input before \bar{E}_a or \bar{E}_b went HIGH. The MR input overrides all other inputs and makes the Q outputs LOW. All inputs have 50 k Ω pull-down resistors.

Features

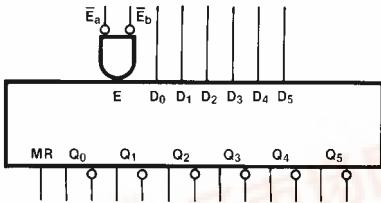

- 20% power reduction of the 100150
- 2000V ESD protection
- Pin/function compatible with 100150
- Voltage compensated operating range = -4.2V to -5.7V

Maximum Junction Temperature (T_J)	+150°C
V_{EE} Pin Potential to Ground Pin	-7.0V to +0.5V

Case Temperature (T_C)	0°C to +85°C
Supply Voltage (V_{EE})	-5.7V to -4.2V

Note 2: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 3: ESD testing conforms to MIL-STD-883, Method 3015.

DC Electrical Characteristics (Note 4)

$V_{EE} = -4.5V$ to $-5.7V$, $V_{CC} = V_{CCA} = GND$, $T_C = 0^\circ C$ to $+85^\circ C$

Note 4: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
