

## Low Charge Injection 16-Channel High Voltage Analog Switch

### Features

- HVCmos technology for high performance
- 16 Channels of high voltage analog switch
- 3.3V input logic level compatible
- 20MHz data shift clock frequency
- Very low quiescent power dissipation -10 $\mu$ A
- Low parasitic capacitance
- DC to 10MHz analog signal frequency
- 60dB typical off-isolation at 5MHz
- CMOS logic circuitry for low power
- Excellent noise immunity
- Cascadable serial data register with latches
- Flexible operating supply voltages

### Applications

- Medical ultrasound imaging
- NDT metal flaw detection
- Piezoelectric transducer drivers
- Optical MEMS modules

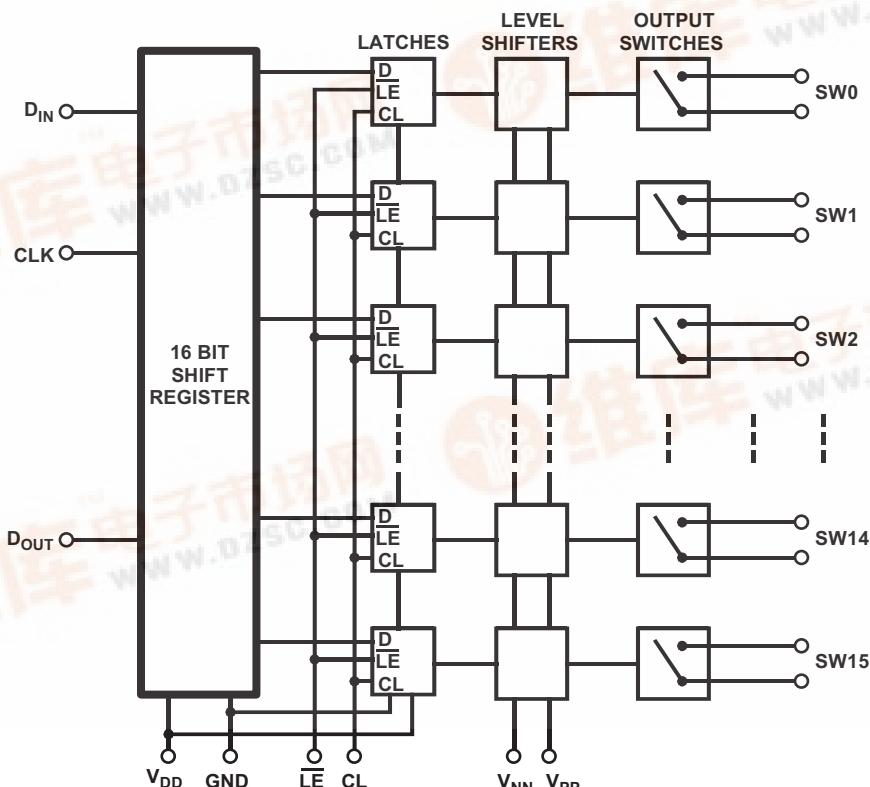

### General Description

The Supertex HV2601 is a low charge injection 16-channel high voltage analog switch integrated circuit (IC) intended for use in applications requiring high voltage switching controlled by low voltage control signals, such as medical ultrasound imaging and other piezoelectric transducer drivers.

Input data is shifted into a 16-bit shift register that can then be retained in a 16-bit latch. To reduce any possible clock feed through noise, the latch enable bar should be left high until all bits are clocked in. Data are clocked in during the rising edge of the clock. Using HVCmos technology, this device combines high voltage bilateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

The device is suitable for various combinations of high voltage supplies, e.g.,  $V_{PP}/V_{NN}$ : +40V/-160V, +100V/-100V, and +160V/-40V.

### Block Diagram

## Ordering Information

DEVICE	Package Options
	48-Lead TQFP
HV2601	HV2601FG-G

-G indicates package is RoHS compliant ('Green')

## Absolute Maximum Ratings

$V_{DD}$ Logic supply	-0.5V to +7V
$V_{PP}$ - $V_{NN}$ differential supply	220V
$V_{PP}$ Positive supply	-0.5V to $V_{NN}$ +200V
$V_{NN}$ Negative supply	+0.5V to -200V
Logic input voltage	-0.5V to $V_{DD}$ +0.3V
Analog signal range	$V_{NN}$ to $V_{PP}$
Peak analog signal current/channel	3.0A
Storage temperature	-65°C to 150°C
Power dissipation	48-Lead TQFP
	1W

\*Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Operation Conditions

Symbol	Parameter	Value
$V_{DD}$	Logic power supply voltage	3.0V to 5.5V
$V_{PP}$	Positive high voltage supply	40V to $V_{NN}$ +200V
$V_{NN}$	Negative high voltage supply	-40V to -160V
$V_{IH}$	High level input voltage	0.9 $V_{DD}$ to $V_{DD}$
$V_{IL}$	Low level input voltage	0V to 0.1 $V_{DD}$
$V_{SIG}$	Analog signal voltage peak-to-peak	$V_{NN}$ +10V to $V_{PP}$ -10V
$T_A$	Operating free air temperature	0°C to 70°C

Notes:

1 Power up/down sequence is arbitrary except GND must be powered-up first and powered-down last.

2  $V_{SIG}$  must be within  $V_{NN}$  and  $V_{PP}$  or floating during power up/down transition.

3 Rise and fall times of power supplies  $V_{DD}$ ,  $V_{PP}$  and  $V_{NN}$  should not be less than 1.0msec.

							L	L									
							L	L									
X	X	X	X	X	X	X	H	L	HOLD PREVIOUS STATE								
X	X	X	X	X	X	X	X	H	ALL SWITCHES OFF								

Notes:

1. The 16 switches operate independently.
2. Serial data is clocked in on the L to H transition of the CLK.
3. All 16 switches go to a state retaining their latched condition at the rising edge of LE. When LE is low the shift registers data flow through the latch.
4.  $D_{OUT}$  is high when data in the register 15 is high.
5. Shift registers clocking has no effect on the switch states if LE is high.
6. The CL clear input overrides all other inputs.
