

ADS-932

16-Bit, 2MHz Sampling A/D Converters

FEATURES

- 16-bit resolution
- 2MHz sampling rate
- Functionally complete
- No missing codes over full military temperature range
- Edge-triggered
- $\pm 5V$ supplies, 1.85 Watts
- Small, 40-pin, ceramic TDIP
- 87dB SNR, $-88dB$ THD
- Ideal for both time and frequency-domain applications

GENERAL DESCRIPTION

The low-cost ADS-932 is a 16-bit, 2MHz sampling A/D converter. This device accurately samples full-scale input signals up to Nyquist frequencies with no missing codes. The dynamic performance of the ADS-932 has been optimized to achieve a signal-to-noise ratio (SNR) of 87dB and a total harmonic distortion (THD) of $-88dB$.

Packaged in a 40-pin TDIP, the functionally complete ADS-932 contains a fast-settling sample-hold amplifier, a subranging (two-pass) A/D converter, an internal reference, timing/control logic, and error-correction circuitry. Digital input and output levels are TTL. The ADS-932 only requires the rising edge of the start convert pulse to operate.

Requiring only $\pm 5V$ supplies, the ADS-932 dissipates 1.85 Watts. The device is offered with a bipolar ($\pm 2.75V$) analog input range or a unipolar (0 to $-5.5V$) input range. Models are available for use in either commercial (0 to $+70^{\circ}C$) or military (-55 to $+125^{\circ}C$) operating temperature ranges. A proprietary, auto-calibrating, error-correcting circuit enables the device to achieve specified performance over the full military temperature range. Typical applications include medical imaging, radar, sonar, communications and instrumentation.

Footnotes:										
① All power supplies must be on before applying a start convert pulse. All supplies and the clock (START CONVERT) must be present during warm-up periods. The device must be continuously converting during this time. There is a slight degradation in performance when operating the device in the unipolar mode.						④ Effective bits is equal to: $(\text{SNR} + \text{Distortion}) - 1.76 + \left[20 \log \frac{\text{Full Scale Amplitude}}{\text{Actual Input Amplitude}} \right]$ 6.02				
② When COMP. BITS (pin 35) is low, logic loading "0" will be -350μA.						⑤ This is the time required before the A/D output data is valid once the analog input is back within the specified range. This time is only guaranteed if the input does not exceed ±4.75V (bipolar) or +2 to -7.5V (unipolar).				
③ A 1MHz clock with a positive pulse width is used for all production testing. See Timing Diagram for more details. 40ns < Start Pulse < 175ns or 280ns < Start Pulse < 460ns						⑥ The minimum supply voltages of +4.9V and -4.9V for ±VDD are required for -55°C operation only. The minimum limits are +4.75V and -4.75V when operating at +125°C.				

TECHNICAL NOTES

- Obtaining fully specified performance from the ADS-932 requires careful attention to pc-card layout and power supply decoupling. The device's analog and digital ground systems are connected to each other internally. For optimal performance, tie all ground pins (4, 7, 30 and 36) directly to a large **analog** ground plane beneath the package.

Bypass all power supplies and the +3.2V reference output to ground with 4.7μF tantalum capacitors in parallel with 0.1μF ceramic capacitors. Locate the bypass capacitors as close to the unit as possible.
- The ADS-932 achieves its specified accuracies without the need for external calibration. If required, the device's small initial offset and gain errors can be reduced to zero using the adjustment circuitry shown in Figure 2. When using this circuitry, or any similar offset and gain calibration hardware, make adjustments following warm-up. To avoid interaction, always adjust offset before gain. Tie pins 5 and 6 to ANALOG GROUND (pin 4) if not using offset and gain adjust circuits.

- Pin 35 (COMP. BITS) is used to select the digital output coding format of the ADS-932 (see Tables 2a and 2b). When this pin has a TTL logic "0" applied, it complements all of the ADS-932's digital outputs.

Pin 35 is TTL compatible and can be directly driven with digital logic in applications requiring dynamic control over its function. There is an internal pull-up resistor on pin 35 allowing it to be either connected to +5V or left open when a logic "1" is required.

- To enable the three-state outputs, connect **OUTPUT ENABLE** (pin 34) to a logic "0" (low). To disable, connect pin 34 to a logic "1" (high).
- Applying a start convert pulse while a conversion is in progress (EOC = logic "1") will initiate a new and probably inaccurate conversion cycle. Data from both the interrupted and subsequent conversions will be invalid.

6. Do not enable/disable or complement the output bits or read from the FIFO during the conversion process (from the rising edge of EOC to the falling edge of EOC).
7. The OVERFLOW bit (pin 33) switches from 0 to 1 when the input voltage exceeds that which produces an output of all 1's or when the input equals or exceeds the voltage that produces all 0's. When COMP BITS is activated, the above conditions are reversed.
8. When configuring the ADS-932 for the unipolar mode, Pin 1 (+3.2V REF.) should be connected to Pin 2 (Unipolar) through a non-inverting op-amp. For precision DC applications an OP-07 type amplifier is recommended, while AC applications requiring the lowest level of harmonic distortion should consider the AD9631.
When configuring the ADS-932 for the bipolar mode, Pin 2 (Unipolar) should be physically disconnected from the surrounding circuitry. This will help prevent noise from coupling into the A/D.

INTERNAL FIFO OPERATION

The ADS-932 contains an internal, user-initiated, 18-bit, 16-word FIFO memory. Each word in the FIFO contains the 16 data bits as well as the MSB and overflow bits. Pins 8 (FIFO/DIR) and 9 (FIFO READ) control the FIFO's operation. The FIFO's status can be monitored by reading pins 10 (FSTAT1) and 11 (FSTAT2).

When pin 8 (FIFO/DIR) has a logic "1" applied, the FIFO is inserted into the digital data path. When pin 8 has a logic "0" applied, the FIFO is transparent and the output data goes directly to the output three-state register (whose operation is controlled by pin 34 (ENABLE)). Read and write commands to the FIFO are ignored when the ADS-932 is operated in the "direct" mode. It takes a maximum of 20ns to switch the FIFO in or out of the ADS-932's digital data path.

FIFO Write and Read Modes

Once the FIFO has been enabled (pin 8 high), digital data is automatically written to it, regardless of the status of FIFO READ (pin 9). Assuming the FIFO is initially empty, it will accept data (18-bit words) from the next 16 consecutive A/D conversions. As a precaution, pin 9 (which controls the FIFO's READ function) should not be low when data is first written to an empty FIFO.

When the FIFO is initially empty, digital data from the first conversion (the "oldest" data) appears at the output of the FIFO immediately after the first conversion has been completed and remains there until the FIFO is read.

If the output three-state register has been enabled (logic "0" applied to pin 34), data from the first conversion will appear at the output of the ADS-932. Attempting to write a 17th word to a full FIFO will result in that data, and any subsequent conversion data, being lost.

Once the FIFO is full (indicated by FSTAT1 and FSTAT2 both equal to "1"), it can be read by dropping the FIFO READ line (pin 9) to a logic "0" and then applying a series of 15 rising edges to the read line. Since the first data word is already present at the FIFO output, the first read command (the first rising edge applied to FIFO READ) will bring data from the second conversion to the output. Each subsequent read command/rising edge brings the next word to the output lines. After the 15th rising edge brings the 16th data word to the FIFO output, the subsequent falling edge on READ will update the status outputs (after a 20ns maximum delay) to FSTAT1 = 0, FSTAT2 = 1 indicating that the FIFO is empty.

If a read command is issued after the FIFO empties, the last word (the 16th conversion) will remain present at the outputs.

FIFO Reset Feature

At any time, the FIFO can be reset to an empty state by putting the ADS-932 into its "direct" mode (logic "0" applied to pin 8, FIFO/DIR) and also applying a logic "0" to the FIFO READ line (pin 9). The empty status of the FIFO will be indicated by FSTAT1 going to a "0" and FSTAT2 going to a "1". The status outputs change 40ns after applying the control signals.

FIFO Status, FSTAT1 and FSTAT2

Monitor the status of the data in the FIFO by reading the two status pins, FSTAT1 (pin 10) and FSTAT2 (pin 11).

CONTENTS	FSTAT1	FSTAT2
Empty (0 words)	0	1
<half full (<8 words)	0	0
half-full or more (≥8 words)	1	0
Full (16 words)	1	1

Table 1. FIFO Delays

DELAY	PIN	TRANSITION	MIN.	TYP.	MAX.	UNITS
Direct mode to FIFO enabled	8		—	10	20	ns
FIFO enabled to direct mode	8		—	10	20	ns
FIFO READ to output data valid	9		—	—	40	ns
FIFO READ to status update when changing from <half full (1 word) to empty	9		—	—	20	ns
FIFO READ to status update when changing from ≥half full (8 words) to <half full (7 words)	9		—	—	110	ns
FIFO READ to status update when changing from full (16 words) to ≥half full (15 words)	9		—	—	190	ns
Falling edge of $\overline{\text{EOC}}$ to status update when writing first word into empty FIFO	32		—	—	190	ns
Falling edge of $\overline{\text{EOC}}$ to status update when changing FIFO from <half full (7 words) to ≥half full (8 words)	32		—	—	110	ns
Falling edge of $\overline{\text{EOC}}$ to status update when filling FIFO with 16th word	32		—	—	28	ns

CALIBRATION PROCEDURE

Connect the converter per Figure 2. Any offset/gain calibration procedures should not be implemented until the device is fully warmed up. To avoid interaction, adjust offset before gain. The ranges of adjustment for the circuits in Figure 2 are guaranteed to compensate for the ADS-932's initial accuracy errors and may not be able to compensate for additional system errors.

A/D converters are calibrated by positioning their digital outputs exactly on the transition point between two adjacent digital output codes. This is accomplished by connecting LED's to the digital outputs and performing adjustments until certain LED's "flicker" equally between on and off. Other approaches employ digital comparators or microcontrollers to detect when the outputs change from one code to the next.

For the ADS-932, offset adjusting is normally accomplished when the analog input is 0 minus ½ LSB ($-42\mu\text{V}$). See Table 2b for the proper bipolar output coding.

Gain adjusting is accomplished when the analog input is at nominal full scale minus 1½ LSB's ($+2.749874\text{V}$).

Note: Connect pin 5 to ANALOG GROUND (pin 4) for operation without zero/offset adjustment. Connect pin 6 to pin 4 for operation without gain adjustment.

Zero/Offset Adjust Procedure

1. Apply a train of pulses to the START CONVERT input (pin

12) so that the converter is continuously converting.

2. For unipolar or bipolar zero/offset adjust, apply $-42\mu\text{V}$ to the ANALOG INPUT (pin 3).
3. For bipolar inputs, adjust the offset potentiometer until the code flickers between 1000 0000 0000 0000 and 0111 1111 1111 1111 with pin 35 tied high (complementary offset binary) or between 0111 1111 1111 1111 and 1000 0000 0000 0000 with pin 35 tied low (offset binary). For unipolar inputs, adjust the offset potentiometers until all output bits are 0's and the LSB flickers between 0 and 1 with Pin 35 tied high (straight binary) or until all bits are 1's and the LSB flickers between 0 and 1 with pin 35 tied low (complementary binary).
4. Two's complement coding requires using BIT 1 (MSB) (pin 29). With pin 35 tied low, adjust the trimpot until the output code flickers between all 0's and all 1's.

Gain Adjust Procedure

1. Apply $+2.749874\text{V}$ to the ANALOG INPUT (pin 3).
2. For bipolar inputs adjust the gain potentiometer until all output bits are 0's and the LSB flickers between a 1 and 0 with pin 35 tied high (complementary offset binary) or until all output bits are 1's and the LSB flickers between a 1 and 0 with pin 35 tied low (offset binary).
3. Two's complement coding requires using BIT 1 (MSB) (pin 29). With pin 35 tied low, adjust the gain trimpot until the output code flickers equally between 0111 1111 1111 1111 and 0111 1111 1111 1110.

Figure 2. Bipolar Connection Diagram

THERMAL REQUIREMENTS

All DATEL sampling A/D converters are fully characterized and specified over operating temperature (case) ranges of 0 to +70°C and –55 to +125°C. All room-temperature ($T_A = +25^\circ\text{C}$) production testing is performed without the use of heat sinks or forced-air cooling. Thermal impedance figures for each device are listed in their respective specification tables.

These devices do not normally require heat sinks, however, standard precautionary design and layout procedures should be used to ensure devices do not overheat. The ground and power planes beneath the package, as well as all pcb signal runs to and from the device, should be as heavy as possible to help conduct heat away from the package. Electrically insulating, thermally-conductive "pads" may be installed

underneath the package. Devices should be soldered to boards rather than "socketed", and of course, minimal air flow over the surface can greatly help reduce the package temperature.

In more severe ambient conditions, the package/junction temperature of a given device can be reduced dramatically (typically 35%) by using one of DATEL's HS Series heat sinks. See Ordering Information for the assigned part number. See page 1-183 of the DATEL Data Acquisition Components Catalog for more information on the HS Series. Request DATEL Application Note AN-8, "Heat Sinks for DIP Data Converters," or contact DATEL directly, for additional information.

- Notes:
1. Scale is approximately 50ns per division. $f_s = 2\text{MHz}$.
 2. This device has three pipeline delays. Four start convert pulses (clock cycles) must be applied for valid data from the first conversion to appear at the output of the A/D.
 3. The start convert positive pulse width must be between either 40 and 175nsec or 280 and 460nsec (when sampling at 1MHz) to ensure proper operation. For sampling rates lower than 1MHz, the start pulse can be wider than 460nsec, however a minimum pulse width low of 40nsec should be maintained. A 1MHz clock with a 100nsec positive pulse width is used for all production testing.

Table 3. Input Connections

Input Range	Input Pin	Connect
0 to -5.5V ±2.75V	Pin 3 Pin 3	Pin 1 To Pin 2 Pin 2 is No Connect

Figure 6. ADS-932 Histogram and Differential Nonlinearity

Figure 7. ADS-932 Grounded Input Histogram

This histogram represents the typical peak-to-peak noise (including quantization noise) associated with the ADS-932.

MECHANICAL DIMENSIONS INCHES (mm)

ORDERING INFORMATION

MODEL	OPERATING TEMP. RANGE	ACCESSORIES
ADS-932MC	0 to +70°C	ADS-B932 Evaluation Board (without ADS-932)
ADS-932MM	-55 to +125°C	HS-40 Heat Sink for all ADS-932 models

Receptacles for PC board mounting can be ordered through AMP, Inc., Part # 3-331272-8 (Component Lead Socket), 40 required. For MIL-STD-883 product, or surface mount packaging, contact DATEL.
