

KA3511DS

Intelligent Voltage Mode PWM IC

Features

- Complete PWM control and house keeping circuitry
- Few external components
- Precision voltage reference trimmed to 2%
- Dual output for push-pull operation
- Each output TR for 200mA sink current
- Variable duty cycle by dead time control
- Soft start capability by using dead time control
- Double pulse suppression logic
- Over voltage protection for 3.3V / 5V / 12V
- Under voltage protection for 3.3V / 5V / 12V
- One more external input for various protection (PT)
- Remote on/off control function (PS-ON)
- Latch function controlled by remote and protection input
- Power good signal generator with hysteresis

Precision reference section

The reference voltage trimmed to $\pm 2\%$
($4.9V \leq V_{ref} \leq 5.1V$)

PG (Power good signal generator) section

Power good signal generator is to monitor the voltage level of power supply for safe operation of a microprocessor. KA3511DS requires few external components to accomplish a complete housekeeping circuits for SMPS.

Description

The KA3511DS is a fixed frequency improved performance pulse width modulation control circuit with complete housekeeping circuitry for use in the secondary side of SMPS (Switched mode power supply). It contains various functions, which are precision voltage reference, over voltage protection, under voltage protection, remote on/off control, power good signal generator and etc.

OVP (Over voltage protection) section

It has OVP functions for +3.3V, +5V, +12V and PT outputs. The circuit is made up of a comparator with four detecting inputs and without hysteresis voltage. Especially, PT (Pin18) is prepared for an extra OVP input or another protection signal.

UVP (Under voltage protection) section

It also has UVP functions for +3.3V, +5V, +12V outputs. The block is made up of a comparator with three detecting inputs and without hysteresis voltage.

Remote on/off section

Remote on/off section is used to control SMPS externally. If a high signal is supplied to the remote on/off input, PWM signal becomes a high state and all secondary outputs are grounded. The remote on/off signal is transferred with some on-delay and off-delay time of 8ms, 24ms respectively.

24-SDIP

Pin Definition : KA3511DS

Pin Number	Pin Name	I/O	Pin Function	Pin Number	Pin Name	I/O	Pin Function Description
1	VCC	I	Supply voltage	13	NC	-	NC
2	COMP	O	E/A output	14	Vref	O	Precision reference VTG
3	E/A(-)	I	E/A (-) input	15	V3.3	I	OVP, UVP input for 3.3V
4	E/A(+)	I	E/A (+) input	16	V5	I	OVP, UVP input for 5V
5	TREM	-	Remote on/off delay	17	V12	I	OVP, UVP input for 12V
6	REM	I	Remote on/off input	18	PT	I	Extra protection input
7	RT	-	Oscillation freq. setting R	19	TUVp	-	UVP delay
8	CT	-	Oscillation freq. setting C	20	GND	-	Signal ground
9	DET	I	Detect input	21	DTC	I	Deadtime control input
10	TPG	-	PG delay	22	C2	O	Output 2
11	PG	O	Power good signal output	23	E	-	Power ground
12	NC	-	NC	24	C1	O	Output 1

Pin Number	Pin Name	Pin Function Description
1	VCC	Supply voltage. Operating range is 10V~30V. VCC=20V, Ta=25°C at test.
2	COMP	Error amplifier output. It is connected to non-inverting input of pulse width modulator comparator.
3	E/A(-)	Error amplifier inverting input. Its reference voltage is always 1.25V.
4	E/A(+)	Error amplifier non-inverting input feedback voltage. This pin may be used to sense power supply output voltage.
5	TREM	Remote on/off delay. Ton/Toff=8ms/24ms (Typ.) with C=0.1uF. Its high/low threshold voltage is 1.8V/0.6V.
6	REM	Remote on/off input. It is TTL operation and its threshold voltage is 1.4V. Voltage at this pin can reach normal 4.6V, with aDSolutely maximum voltage, 5.25V. If REM = "Low", PWM = "Low". That means the main SMPS is operational. When REM = "High", then PWM = "High" and the main SMPS is turned-off.
7	RT	Oscillation frequency setting R. (Test Condition RT=10kΩ)
8	CT	Oscillation frequency setting C. (Test Condition CT=0.01uF)
9	DET	Under voltage detection pin. Its threshold voltage is 1.25V Typ.
10	TPG	PG delay. Td=250ms (Typ) with CPG=2.2uF. The high/low threshold voltage are 1.8V/0.6V and the voltage of Pin10 is clamped at 2.9V for noise margin.
11	PG	Power good output signal. PG = "High" means that the power is "Good" for operation and PG = "Low" means "Power fail".
14	Vref	Precision voltage reference trimmed to 2%. (Typical Value = 5.03V)
15	V3.3	OVP, UVP input for output 3.3V. (Typical Value = 4.1V/2.3V)
16	V5	OVP, UVP input for output 5V. (Typical Value = 6.4V/4.0V)
17	V12	OVP, UVP input for output 12V. (Typical Value = 14.2V/10V)
18	PT	This is prepared for an extra OVP input or another protection signal. (Typical Value = 1.25V)
19	TUVP	Timing pin for under voltage protection blank-out time. Its threshold voltage is 1.8V and clamped at 2.9V after full charging. Target of delay time is 250ms and it is realized through external (C=2.2uF).
20	GND	Signal ground.
21	DTC	Deadtime control input. The dead-time control comparator has an effective 120mV input offset which limits the minimum output dead time. Dead time may be imposed on the output by setting the dead time control input to a fixed voltage, ranging between 0V to 3.3V.
22	C2	Output drive pin for push-pull operation.
23	E	Power ground.
24	C1	Output drive pin for push-pull operation.

Electrical Characteristics (V_{CC}=20V, T_a=25°C)

Parameter	Symbol	Condition	Min.	Typ.	Max.	Unit
REFERENCE SECTION
