Sink Current Capability up to 100mA

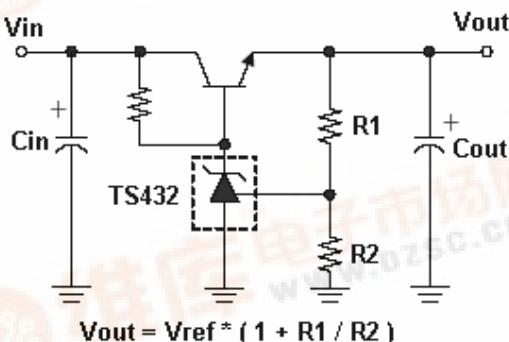

General Description

The TS432/432A/432B is a three-terminal adjustable shunt regulator with specified thermal stability. The output voltage may be set to any value between Vref (approximately 1.24V) and 18V with two external resistors. The TS432/432A/432B has a typical output impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic, making the TS432/432A/432B excellent replacement for zener diode in many applications. This series is offered in 3-pin TO-92, SOT-89, SOT-23 and 5-pin SOT-25 package.

Note 4. Deviation of reference input voltage, V_{DEV} , is defined as the maximum deviation of the reference over the full temperature range.

The average temperature coefficient of the reference input voltage αV_{ref} is defined as:

$$|\alpha V_{ref}| = [V_{DEV} / V_{ref}(25)] * 10^6 / T_2 - T_1 \text{ (PPM/}^\circ\text{C)}$$

Where: T_2-T_1 = full temperature change.

αV_{ref} can be positive or negative depending on whether the slope is positive or negative.

Note 5. The dynamic output impedance, R_z , is defined as:

$$|Z_{ka}| = \Delta V_{ka} / \Delta I_{ka}$$

When the device is programmed with two external resistors R_1 and R_2 (see Figure 2). The dynamic output impedance of the overall circuit, is defined as :

$$|Z_{ka}| = \Delta V / \Delta I \approx |Z_{ka}| * (1 + R_1 / R_2)$$

Typical Performance Characteristics

the area under the curves represent conditions that may cause the device to oscillate. for curves B, C and D, R2 and V+ were adjusted to establish the initial V_{ka} and I_{ka} conditions with CL=0. V_{batt} and CL were then adjusted to determine the ranges of stability.
