

## OPAx835 Ultra-Low-Power, Rail-to-Rail Out, Negative Rail In, VFB Op Amp

### 1 Features

- Ultra-Low Power
  - Supply Voltage: 2.5 V to 5.5 V
  - Quiescent Current: 250  $\mu$ A/ch (Typical)
  - Power Down Mode: 0.5  $\mu$ A (Typical)
- Bandwidth: 56 MHz ( $A_V = 1$  V/V)
- Slew Rate: 160 V/ $\mu$ s
- Rise Time: 10 ns ( $2 V_{STEP}$ )
- Settling Time (0.1%): 55 ns ( $2 V_{STEP}$ )
- Overdrive Recovery Time: 200 ns
- SNR: 0.00015% ( $-116.4$  dBc) at 1 kHz ( $1 V_{RMS}$ )
- THD: 0.00003% ( $-130$  dBc) at 1 kHz ( $1 V_{RMS}$ )
- $HD_2/HD_3$ :  $-70$  dBc/ $-73$  dBc at 1 MHz ( $2 V_{PP}$ )
- Input Voltage Noise: 9.3 nV/ $\sqrt{Hz}$  ( $f = 100$  kHz)
- Input Offset Voltage: 100  $\mu$ V ( $\pm 500$ - $\mu$ V Maximum)
- CMRR: 113 dB
- Output Current Drive: 40 mA
- RRO: Rail-to-Rail Output
- Input Voltage Range:  $-0.2$  V to 3.9 V (5-V Supply)
- Operating Temperature Range:  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$

### 2 Applications

- Low-Power Signal Conditioning
- Audio ADC Input Buffer
- Low-Power SAR and  $\Delta\Sigma$  ADC Driver
- Portable Systems
- Low-Power Systems
- High-Density Systems
- Ultrasonic Flow Meter

### 3 Description

The OPA835 and OPA2835 devices (OPAx835) are single and dual ultra-low-power, rail-to-rail output, negative-rail input, voltage-feedback (VFB) operational amplifiers designed to operate over a power supply range of 2.5-V to 5.5-V with a single supply, or  $\pm 1.25$ -V to  $\pm 2.75$ -V with a dual supply. Consuming only 250  $\mu$ A per channel and with a unity gain bandwidth of 56 MHz, these amplifiers set an industry-leading performance-to-power ratio for rail-to-rail amplifiers.

For battery-powered, portable applications where power is of key importance, the low power consumption and high-frequency performance of the OPA835 and OPA2835 devices offers performance versus power that is not attainable in other devices. Coupled with a power-savings mode to reduce current to  $< 1.5$   $\mu$ A, these devices offer an attractive solution for high-frequency amplifiers in battery-powered applications.

The OPA835 RUN package option includes integrated gain-setting resistors for the smallest possible footprint on a printed-circuit-board (approximately 2.00 mm  $\times$  2.00 mm). By adding circuit traces on the PCB, gains of +1,  $-1$ ,  $-1.33$ , +2, +2.33,  $-3$ , +4,  $-4$ , +5,  $-5.33$ , +6.33,  $-7$ , +8 and inverting attenuations of  $-0.1429$ ,  $-0.1875$ ,  $-0.25$ ,  $-0.33$ ,  $-0.75$  can be achieved. See [Table 3](#) and [Table 4](#) for details.

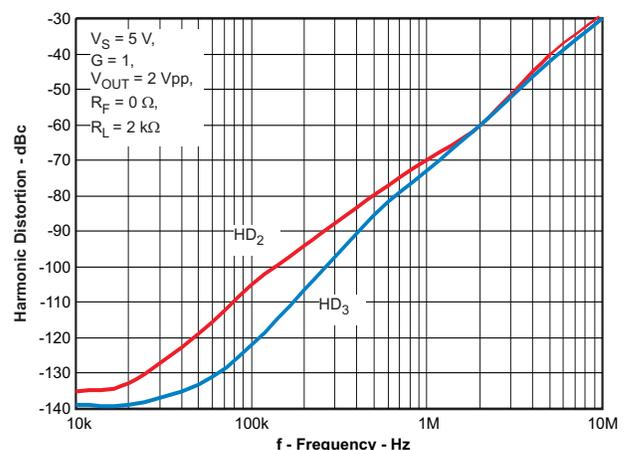

The OPA835 and OPA2835 devices are characterized for operation over the extended industrial temperature range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ .

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
OPA835	SOT-23 (6)	2.90 mm $\times$ 1.60 mm
	QFN (10)	2.00 mm $\times$ 2.00 mm
OPA2835	SOIC (8)	4.90 mm $\times$ 3.91 mm
	VSSOP (10)	3.00 mm $\times$ 3.00 mm
	UQFN (10)	2.00 mm $\times$ 2.00 mm
	QFN (10)	2.00 mm $\times$ 2.00 mm

(1) For all available packages, see the package option addendum at the end of the data sheet.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision H (November 2015) to Revision I</b>	<b>Page</b>
• Reformatted table note on <i>Thermal Information: OPA835</i> and <i>Thermal Information: OPA2835</i> tables .....	<b>7</b>
• Deleted the word "linear" from output voltage low, output voltage high, and output current drive parameters in <i>Electrical Characteristics: <math>V_S = 2.7\text{ V}</math></i> table .....	<b>9</b>
• Changed Current noise 1/f corner frequency parameter units from Hz to kHz in <i>Electrical Characteristics: <math>V_S = 5\text{ V}</math></i> table .....	<b>11</b>
• Deleted the word "linear" from output voltage low, output voltage high, and output current drive parameters in <i>Electrical Characteristics: <math>V_S = 5\text{ V}</math></i> table .....	<b>12</b>
• Reformatted <i>Development Support</i> section .....	<b>43</b>
• Reformatted <i>Related Documentation</i> section .....	<b>43</b>

<b>Changes from Revision F (June 2015) to Revision G</b>	<b>Page</b>
• Moved all switching parameters from the <i>Switching Characteristics: <math>V_S = 2.7\text{ V}</math></i> back into the <i>Electrical Characteristics: <math>V_S = 2.7\text{ V}</math></i> table .....	<b>8</b>
• Moved all switching parameters from the <i>Switching Characteristics: <math>V_S = 5\text{ V}</math></i> table back into the <i>Electrical Characteristics: <math>V_S = 5\text{ V}</math></i> table .....	<b>10</b>

<b>Changes from Revision E (July 2013) to Revision F</b>	<b>Page</b>
• Added <i>Pin Configuration and Functions</i> section, <i>ESD Ratings</i> table, <i>Switching Characteristics</i> tables, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	<b>1</b>
• Moved the switching parameters from the <i>Electrical Characteristics</i> tables into <i>Switching Characteristics</i> tables. ....	<b>11</b>

---

Changes from Revision D (October 2011) to Revision E	Page
• Added RMC package to document.....	1
• Added RMC to <i>Thermal Information</i> table.....	7

---

---

**Changes from Revision C (September 2011) to Revision D** **Page**

---

• Removed Product Preview from OPA835IRUNT and OPA835IRUNR .....	5
• Changed Resistor temperature coefficient typical value from TBD to < 10 .....	10
• "Changed Quiescent operating current" parameter to "Quiescent operating current per amplifier" .....	10
• Changed Resistor temperature coefficient parameter units from TBD to < 10 .....	12
• Changed Quiescent operating current parameter to Quiescent operating current per amplifier .....	12

---

**Changes from Revision B (May 2011) to Revision C** **Page**

---

• Removed Product Preview from all devices except OPA835IRUNT and OPA835IRUNR .....	5
• Changed - Channel to channel crosstalk (OPA2835) typical value from TBD to -120 dB .....	9
• Changed the Common-mode rejection ratio minimum value from 91 dB to 88 dB.....	9
• Added GAIN-SETTING RESISTORS (OPA835IRUN ONLY) parameter.....	10
• Changed the Quiescent operating current per amplifier( $T_A = 25^\circ\text{C}$ ) parameter minimum value from 190 $\mu\text{A}$ to 175 $\mu\text{A}$ .....	10
• Changed the Power supply rejection ( $\pm\text{PSRR}$ ) minimum value from 91 dB to 88 dB .....	10
• Changed the Power-down pin bias current test conditions from $\overline{\text{PD}} = 0.7\text{ V}$ to $\overline{\text{PD}} = 0.5\text{ V}$ .....	10
• Changed the Power-down quiescent current test conditions from $\overline{\text{PD}} = 0.7\text{ V}$ to $\overline{\text{PD}} = 0.5\text{ V}$ .....	10
• Changed Channel to channel crosstalk (OPA2835) typical value from TBD to -120 dB .....	11
• Changed the common-mode rejection ratio minimum value from 94 dB to 91 dB.....	12
• Added GAIN-SETTING RESISTORS (OPA835IRUN ONLY) parameter.....	12
• Changed the Quiescent operating current ( $T_A = 25^\circ\text{C}$ ) Min value From: 215 $\mu\text{A}$ To: 200 $\mu\text{A}$ .....	12
• Changed the Power supply rejection ( $\pm\text{PSRR}$ ) minimum value from 93 dB to 90 dB .....	12
• Changed the Power-down quiescent current test conditions from $\overline{\text{PD}} = 0.7\text{ V}$ to $\overline{\text{PD}} = 0.5\text{ V}$ .....	12
• Changed the Power-down quiescent current test conditions from $\overline{\text{PD}} = 0.7\text{ V}$ to $\overline{\text{PD}} = 0.5\text{ V}$ .....	12
• Added Figure Crosstalk vs Frequency .....	16
• Added Figure Crosstalk vs Frequency .....	22
• Added <i>Single-Ended to Differential Amplifier</i> section .....	32

---

**Changes from Revision A (March 2011) to Revision B** **Page**

---

• Changed OPA835 from product preview to production data.....	1
---	---

---

V <sub>S-</sub>	2	5	4	4	5	POW	Negative power supply input

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
$V_{S-}$ to $V_{S+}$	Supply voltage		5.5	V
$V_I$	Input voltage	$V_{S-} - 0.7$	$V_{S+} + 0.7$	V
$V_{ID}$	Differential input voltage		1	V
$I_I$	Continuous input current		0.85	mA
$I_O$	Continuous output current		60	mA
	Continuous power dissipation	See <a href="#">Thermal Information: OPA835</a> and <a href="#">Thermal Information: OPA2835</a>		
$T_J$	Maximum junction temperature		150	°C
$T_A$	Operating free-air temperature	-40	125	°C
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±6000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000
		Machine model	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{S+}$	Single supply voltage	2.5	5	5.5	V
$T_A$	Ambient temperature	-40	25	125	°C

### 7.4 Thermal Information: OPA835

THERMAL METRIC <sup>(1)</sup>	OPA835		UNIT	
	DBV (SOT23-6)	RUN (QFN)		
	6 PINS	10 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	194	145.8	°C/W
$R_{\theta Jc top}$	Junction-to-case (top) thermal resistance	129.2	75.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	39.4	38.9	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	25.6	13.5	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	38.9	104.5	°C/W

- (1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#) (SPRA953).

### 7.5 Thermal Information: OPA2835

THERMAL METRIC <sup>(1)</sup>	OPA2835				UNIT	
	D (SOIC)	DGS (VSSOP)	RUN (QFN)	RMC (UQFN)		
	8 PINS	10 PINS	10 PINS	10 PINS		
$R_{\theta JA}$	Junction-to-ambient thermal resistance	150.1	206	145.8	143.2	°C/W

- (1) For more information about traditional and new thermal metrics, see [Semiconductor and IC Package Thermal Metrics](#) (SPRA953).

**Thermal Information: OPA2835 (continued)**

THERMAL METRIC <sup>(1)</sup>		OPA2835				UNIT
		D (SOIC)	DGS (VSSOP)	RUN (QFN)	RMC (UQFN)	
		8 PINS	10 PINS	10 PINS	10 PINS	
R <sub>θJCtop</sub>	Junction-to-case (top) thermal resistance	83.8	75.3	75.1	49.0	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	68.4	96.2	38.9	61.9	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	33.0	12.9	13.5	3.3	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	67.9	94.6	104.5	61.9	°C/W

**7.6 Electrical Characteristics: V<sub>S</sub> = 2.7 V**

at V<sub>S+</sub> = +2.7 V, V<sub>S-</sub> = 0 V, V<sub>OUT</sub> = 1 V<sub>PP</sub>, R<sub>F</sub> = 0 Ω, R<sub>L</sub> = 2 kΩ, G = 1 V/V, input and output referenced to mid-supply, V<sub>IN,CM</sub> = mid-supply – 0.5 V. T<sub>A</sub> = 25°C, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	TEST LEVEL <sup>(1)</sup>
<b>AC PERFORMANCE</b>						
Small-signal bandwidth	V <sub>OUT</sub> = 100 mV <sub>PP</sub> , G = 1		51		MHz	C
	V <sub>OUT</sub> = 100 mV <sub>PP</sub> , G = 2		22.5			
	V <sub>OUT</sub> = 100 mV <sub>PP</sub> , G = 5		7.2			
	V <sub>OUT</sub> = 100 mV <sub>PP</sub> , G = 10		3			
Gain-bandwidth product	V <sub>OUT</sub> = 100 mV <sub>PP</sub> , G = 10		30		MHz	C
Large-signal bandwidth	V <sub>OUT</sub> = 1 V <sub>PP</sub> , G = 1		24		MHz	C
Bandwidth for 0.1-dB flatness	V <sub>OUT</sub> = 1 V <sub>PP</sub> , G = 2		4		MHz	C
Slew rate, rise	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		110		V/μs	C
Slew rate, fall	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		130		V/μs	C
Rise time	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		9.5		ns	C
Fall time	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		9		ns	C
Settling time to 1%, rise	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		35		ns	C
Settling time to 1%, fall	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		30		ns	C
Settling time to 0.1%, rise	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		60		ns	C
Settling time to 0.1%, fall	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		65		ns	C
Settling time to 0.01%, rise	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		120		ns	C
Settling time to 0.01%, fall	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		90		ns	C
Overshoot/Undershoot	V <sub>OUT</sub> = 1 V <sub>STEP</sub> , G = 2		0.5%/0.2%			C
Second-order harmonic distortion	f = 10 kHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-133		dBc	C
	f = 100 kHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-110			
	f = 1 MHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-73			
Third-order harmonic distortion	f = 10 kHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-137		dBc	C
	f = 100 kHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-125			
	f = 1 MHz, V <sub>IN,CM</sub> = mid-supply – 0.5 V		-78			
Second-order intermodulation distortion	f = 1 MHz, 200-kHz Tone Spacing, V <sub>OUT</sub> Envelope = 1 V <sub>PP</sub> , V <sub>IN,CM</sub> = mid-supply – 0.5 V		-75		dBc	C
Third-order intermodulation distortion	f = 1 MHz, 200-kHz Tone Spacing, V <sub>OUT</sub> Envelope = 1 V <sub>PP</sub> , V <sub>IN,CM</sub> = mid-supply – 0.5 V		-81		dBc	C
Input voltage noise	f = 100 kHz		9.3		nV/√Hz	C
Voltage noise 1/f corner frequency			147		Hz	C

(1) Test levels (all values set by characterization and simulation): **(A)** 100% tested at 25°C; over temperature limits by characterization and simulation. **(B)** Not tested in production; limits set by characterization and simulation. **(C)** Typical value only for information.

**Electrical Characteristics:  $V_S = 2.7\text{ V}$  (continued)**

at  $V_{S+} = +2.7\text{ V}$ ,  $V_{S-} = 0\text{ V}$ ,  $V_{OUT} = 1\text{ V}_{PP}$ ,  $R_F = 0\ \Omega$ ,  $R_L = 2\text{ k}\Omega$ ,  $G = 1\text{ V/V}$ , input and output referenced to mid-supply,  $V_{IN,CM} = \text{mid-supply} - 0.5\text{ V}$ .  $T_A = 25^\circ\text{C}$ , unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT	TEST LEVEL <sup>(1)</sup>
<b>AC PERFORMANCE (continued)</b>						
Input current noise	$f = 1\text{ MHz}$		0.45		$\text{pA}/\sqrt{\text{Hz}}$	C

## 8 Detailed Description

### 8.1 Overview

The OPAx835 family of bipolar-input operational amplifiers offers excellent bandwidth of 56 MHz with ultra-low THD of 0.00003% at 1 kHz. The device can swing to within 200 mV of the supply rails while driving a 2-k $\Omega$  load. The input common-mode of the amplifier can swing to 200 mV below the negative supply rail. This level of performance is achieved at 250  $\mu$ A of quiescent current per amplifier channel.

### 8.2 Functional Block Diagram

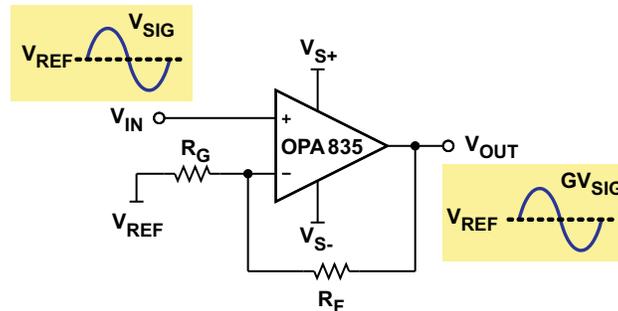

Figure 53. Noninverting Amplifier

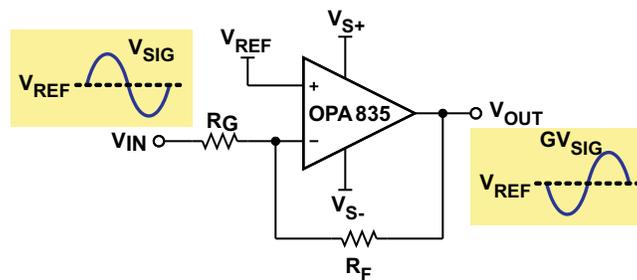

Figure 54. Inverting Amplifier

### 8.3 Feature Description

#### 8.3.1 Input Common-Mode Voltage Range

When the primary design goal is a linear amplifier, with high CMRR, it is important to not violate the input common-mode voltage range ( $V_{ICR}$ ) of an op amp.

The common-mode input range specifications in the table data use CMRR to set the limit. The limits are selected to ensure CMRR will not degrade more than 3 dB below the CMRR limit if the input voltage is kept within the specified range. The limits cover all process variations, and most parts will be better than specified. The typical specifications are 0.2 V below the negative rail and 1.1 V below the positive rail.

Assuming the op amp is in linear operation, the voltage difference between the input pins is small (ideally 0 V); and the input common-mode voltage is analyzed at either input pin with the other input pin assumed to be at the same potential. The voltage at  $V_{IN+}$  is simple to evaluate. In noninverting configuration, [Figure 53](#), the input signal,  $V_{IN}$ , must not violate the  $V_{ICR}$ . In inverting configuration, as shown in [Figure 54](#), the reference voltage,  $V_{REF}$ , must be within the  $V_{ICR}$ .

The input voltage limits have fixed headroom to the power rails and track the power supply voltages. For one 5-V supply, the linear input voltage ranges from  $-0.2$  V to 3.9 V and  $-0.2$  V to 1.6 V for a 2.7-V supply. The delta headroom from each power supply rail is the same in either case:  $-0.2$  V and 1.1 V.

## Feature Description (continued)

### 8.3.2 Output Voltage Range

The OPA835 and OPA2835 devices are rail-to-rail output (RRO) op amps. Rail-to-rail output typically means that the output voltage swings within a couple hundred millivolts of the supply rails. There are different ways to specify this: one is with the output still in linear operation and another is with the output saturated. Saturated output voltages are closer to the power supply rails than linear outputs, but the signal is not a linear representation of the input. Linear output is a better representation of how well a device performs when used as a linear amplifier. Saturation and linear operation limits are affected by the output current, where higher currents lead to more loss in the output transistors.

The specification tables list linear and saturated output voltage specifications with 2-k $\Omega$  load. [Figure 11](#) and [Figure 37](#) show saturated voltage-swing limits versus output load resistance, and [Figure 12](#) and [Figure 38](#) show the output saturation voltage versus load current. Given a light load, the output voltage limits have nearly constant headroom to the power rails and track the power supply voltages. For example, with a 2-k $\Omega$  load and a single 5-V supply, the linear output voltage ranges from 0.15 V to 4.8 V and ranges from 0.15 V to 2.5 V for a 2.7-V supply. The delta from each power supply rail is the same in either case: 0.15 V and 0.2 V.

With devices like the OPA835 and OPA2835 where the input range is lower than the output range, typically the input will limit the available signal swing only in noninverting gain of 1. Signal swing in noninverting configurations in gains  $> +1$  and inverting configurations in any gain is typically limited by the output voltage limits of the op amp.

### 8.3.3 Power-Down Operation

The OPA835 and OPA2835 devices include a power-down mode. Under logic control, the amplifiers can switch from normal operation to a standby current of  $< 1.5 \mu\text{A}$ . When the PD pin is connected high, the amplifier is active. Connecting  $\overline{\text{PD}}$  pin low disables the amplifier and places the output in a high-impedance state. When the amplifier is configured as a unity-gain buffer, the output stage is in a high dc-impedance state. To protect the input stage of the amplifier, the devices use internal, back-to-back ESD diodes between the inverting and noninverting input pins. This configuration creates a parallel low-impedance path from the amplifier output to the noninverting pin when the differential voltage between the pins exceeds a diode voltage drop. When the op amp is configured in other gains, the feedback (RF) and gain (RG) resistor network forms a parallel load.

The  $\overline{\text{PD}}$  pin must be actively driven high or low and must not be left floating. If the power-down mode is not used,  $\overline{\text{PD}}$  must be tied to the positive supply rail.

$\overline{\text{PD}}$  logic states are TTL with reference to the negative supply rail,  $V_{\text{S-}}$ . When the op amp is powered from a single-supply and ground, driven from logic devices with similar  $V_{\text{DD}}$  voltages to the op amp do not require any special consideration. When the op amp is powered from a split supply, with  $V_{\text{S-}}$  below ground, an open-collector type of interface with a pullup resistor is more appropriate. Pullup resistor values must be lower than 100 k $\Omega$ . Additionally, the drive logic must be negated due to the inverting action of an open-collector gate.

### 8.3.4 Low-Power Applications and the Effects of Resistor Values on Bandwidth

The OPA835 and OPA2835 devices are designed for the nominal value of  $R_{\text{F}}$  to be 2 k $\Omega$  in gains other than  $+1$ . This gives excellent distortion performance, maximum bandwidth, best flatness, and best pulse response. It also loads the amplifier. For example; in gain of 2 with  $R_{\text{F}} = R_{\text{G}} = 2 \text{ k}\Omega$ ,  $R_{\text{G}}$  to ground, and  $V_{\text{OUT}} = 4 \text{ V}$ , 1 mA of current will flow through the feedback path to ground. In gain of  $+1$ ,  $R_{\text{G}}$  is open and no current will flow to ground. In low-power applications, it is desirable to reduce the current in the feedback path by increasing the gain-setting resistors values. Using larger value gain resistors has two primary side effects (other than lower power) due to their interaction with parasitic circuit capacitance.

- Lowers the bandwidth
- Lowers the phase margin
  - This causes peaking in the frequency response
  - This causes overshoot and ringing in the pulse response

[Figure 55](#) shows the small-signal frequency response on OPA835EVM for noninverting gain of 2 with  $R_{\text{F}}$  and  $R_{\text{G}}$  equal to 2 k $\Omega$ , 10 k $\Omega$ , and 100 k $\Omega$ . The test was done with  $R_{\text{L}} = 2 \text{ k}\Omega$ . Due to loading effects of  $R_{\text{L}}$ , lower  $R_{\text{L}}$  values may reduce the peaking, but higher values will not have a significant effect.

Feature Description (continued)

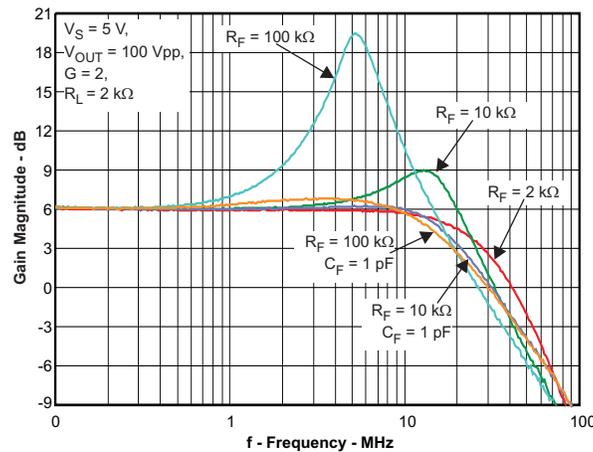

Figure 55. Frequency Response With Various Gain-Setting Resistor Values

As expected, larger value gain resistors cause lower bandwidth and peaking in the response (peaking in frequency response is synonymous with overshoot and ringing in pulse response). Adding 1-pF capacitors in parallel with  $R_F$  helps compensate the phase margin and restores flat frequency response. Figure 56 shows the test circuit.

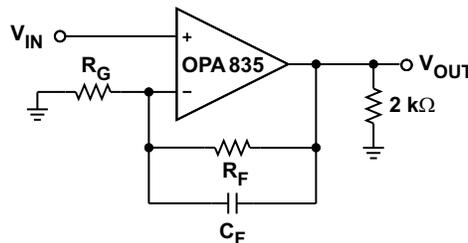

Figure 56.  $G = 2$  Test Circuit for Various Gain-Setting Resistor Values

8.3.5 Driving Capacitive Loads

The OPA835 and OPA2835 devices drive up to a nominal capacitive load of 10 pF on the output with no special consideration. When driving capacitive loads greater than 10 pF, TI recommends using a small resistor ( $R_O$ ) in series with the output as close to the device as possible. Without  $R_O$ , output capacitance interacts with the output impedance of the amplifier causing phase shift in the loop gain of the amplifier that will reduce the phase margin. This will cause peaking in the frequency response and overshoot and ringing in the pulse response. Interaction with other parasitic elements may lead to instability or oscillation. Inserting  $R_O$  will isolate the phase shift from the loop gain path and restore the phase margin; however  $R_O$  can limit the bandwidth slightly.

Figure 57 shows the test circuit and Figure 41 shows the recommended values of  $R_O$  versus capacitive loads,  $C_L$ . See Figure 40 for the frequency responses with various values.

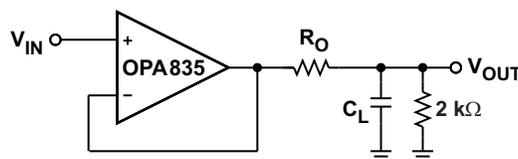

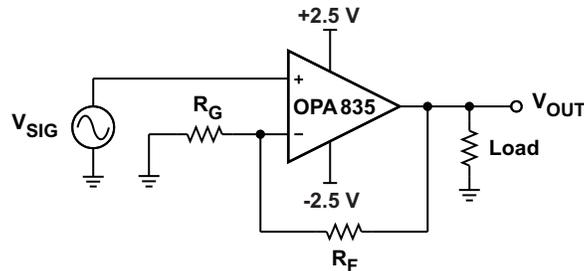

Figure 57.  $R_O$  versus  $C_L$  Test Circuit

## 8.4 Device Functional Modes

### 8.4.1 Split-Supply Operation ( $\pm 1.25\text{ V}$ to $\pm 2.75\text{ V}$ )

To facilitate testing with common lab equipment, the OPA835 EVM ( see [OPA835DBV and OPA836DBV EVM User's Guide](#) (SLOU314) ) is built to allow split-supply operation. This configuration eases lab testing because the mid-point between the power rails is ground, and most signal generators, network analyzers, oscilloscopes, spectrum analyzers and other lab equipment have inputs and outputs with a ground reference.

[Figure 58](#) shows a simple noninverting configuration analogous to [Figure 53](#) with  $\pm 2.5\text{-V}$  supply and  $V_{\text{REF}}$  equal to ground. The input and output will swing symmetrically around ground. For ease of use, split supplies are preferred in systems where signals swing around ground.

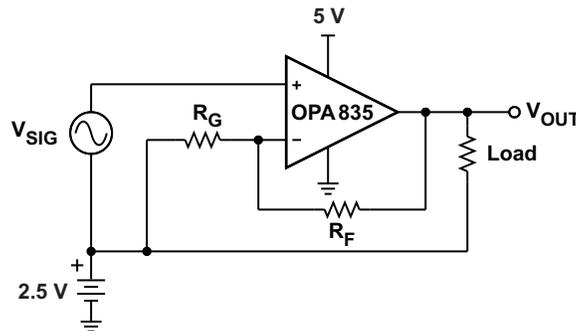

**Figure 58. Split-Supply Operation**

### 8.4.2 Single-Supply Operation (2.5 V to 5.5 V)

Often, newer systems use a single power supply to improve efficiency and reduce the cost of the power supply. OPA835 and OPA2835 devices are designed for use with single-supply power operation and can be used with single-supply power with no change in performance from split supply, as long as the input and output are biased within the linear operation of the device.

To change the circuit from split supply to single-supply, level shift all voltages by  $\frac{1}{2}$  the difference between the power supply rails. For example, changing from  $\pm 2.5\text{-V}$  split supply to  $5\text{-V}$  single-supply is shown in [Figure 59](#).

**Figure 59. Single-Supply Concept**

A practical circuit will have an amplifier or other circuit providing the bias voltage for the input, and the output of this amplifier stage provides the bias for the next stage.

[Figure 60](#) shows a typical noninverting amplifier circuit. With  $5\text{-V}$  single-supply, a mid-supply reference generator is needed to bias the negative side through  $R_G$ . To cancel the voltage offset that would otherwise be caused by the input bias currents,  $R_1$  is selected to be equal to  $R_F$  in parallel with  $R_G$ . For example if gain of 2 is required and  $R_F = 2\text{ k}\Omega$ , select  $R_G = 2\text{ k}\Omega$  to set the gain, and  $R_1 = 1\text{ k}\Omega$  for bias current cancellation. The value for  $C$  is dependent on the reference, and TI recommends a value of at least  $0.1\text{ }\mu\text{F}$  to limit noise.

Device Functional Modes (continued)

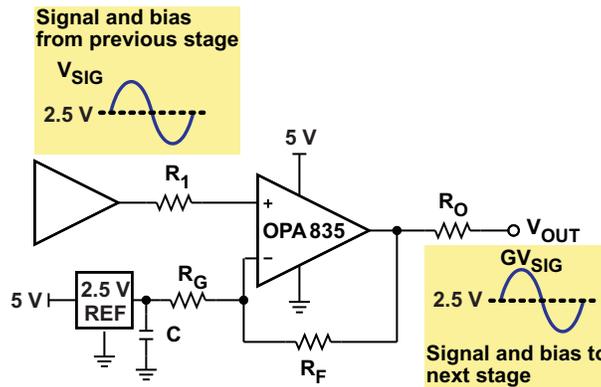

Figure 60. Noninverting Single Supply With Reference

Figure 61 shows a similar noninverting single-supply scenario with the reference generator replaced by the Thevenin equivalent using resistors and the positive supply.  $R_G'$  and  $R_G''$  form a resistor divider from the 5-V supply and are used to bias the negative side with the parallel sum equal to the equivalent  $R_G$  to set the gain. To cancel the voltage offset that would otherwise be caused by the input bias currents,  $R_1$  is selected to be equal to  $R_F$  in parallel with  $R_G'$  in parallel with  $R_G''$  ( $R_1 = R_F \parallel R_G' \parallel R_G''$ ). For example, if a gain of 2 is required and  $R_F = 2 \text{ k}\Omega$ , selecting  $R_G' = R_G'' = 4 \text{ k}\Omega$  gives equivalent parallel sum of  $2 \text{ k}\Omega$ , sets the gain to 2, and references the input to mid supply (2.5 V).  $R_1$  is set to  $1 \text{ k}\Omega$  for bias current cancellation. The resistor divider costs less than the 2.5-V reference in Figure 60 but may increase the current from the 5-V supply.

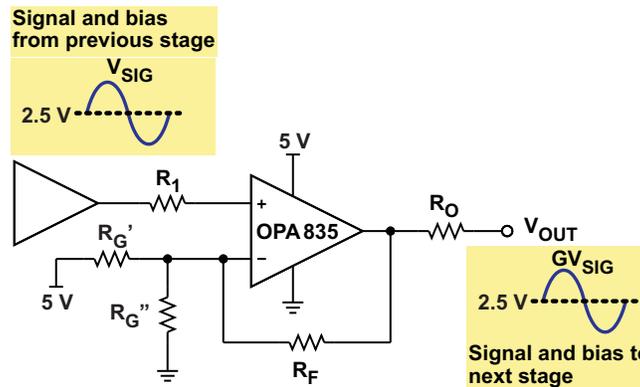

Figure 61. Noninverting Single Supply With Resistors

Figure 62 shows a typical inverting-amplifier circuit. With a 5-V single-supply, a mid-supply reference generator is needed to bias the positive side through  $R_1$ . To cancel the voltage offset that would otherwise be caused by the input bias currents,  $R_1$  is selected to be equal to  $R_F$  in parallel with  $R_G$ . For example, if a gain of  $-2$  is required and  $R_F = 2 \text{ k}\Omega$ , select  $R_G = 1 \text{ k}\Omega$  to set the gain and  $R_1 = 667 \Omega$  for bias current cancellation. The value for  $C$  is dependent on the reference, but TI recommends a value of at least  $0.1 \mu\text{F}$  to limit noise into the op amp.

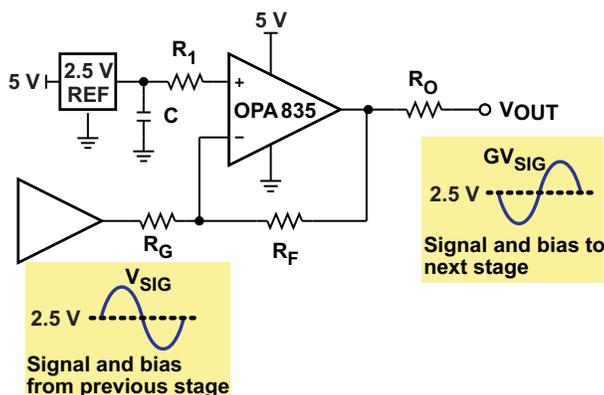

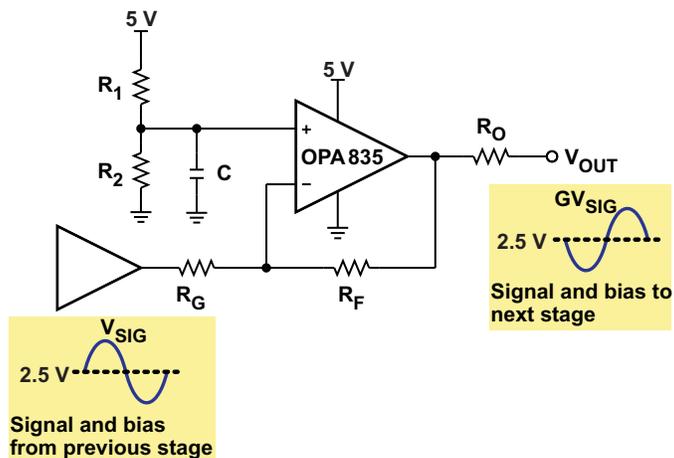

**Device Functional Modes (continued)**

**Figure 62. Inverting Single Supply With Reference**

Figure 63 shows a similar inverting single-supply scenario with the reference generator replaced by the Thevenin equivalent using resistors and the positive supply.  $R_1$  and  $R_2$  form a resistor divider from the 5-V supply and are used to bias the positive side. To cancel the voltage offset that would otherwise be caused by the input bias currents, set the parallel sum of  $R_1$  and  $R_2$  equal to the parallel sum of  $R_F$  and  $R_G$ .  $C$  must be added to limit coupling of noise into the positive input. For example, if gain of  $-2$  is required and  $R_F = 2\text{ k}\Omega$ , select  $R_G = 1\text{ k}\Omega$  to set the gain.  $R_1 = R_2 = 667\text{ }\Omega$  for mid-supply voltage bias and for op-amp input-bias current cancellation. A good value for  $C$  is  $0.1\text{ }\mu\text{F}$ . The resistor divider costs less than the 2.5-V reference in Figure 62 but may increase the current from the 5-V supply.

**Figure 63. Inverting Single Supply With Resistors**

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

#### 9.1.1 Noninverting Amplifier

The OPA835 and OPA2835 devices can be used as noninverting amplifiers with signal input to the noninverting input,  $V_{IN+}$ . A basic block diagram of the circuit is shown in [Figure 53](#).

If  $V_{IN} = V_{REF} + V_{SIG}$ , the amplifier output may be calculated according to [Equation 1](#).

$$V_{OUT} = V_{SIG} \left( 1 + \frac{R_F}{R_G} \right) + V_{REF} \quad (1)$$

$$G = 1 + \frac{R_F}{R_G}$$

The signal gain of the circuit is set by  $\frac{R_F}{R_G}$ , and  $V_{REF}$  provides a reference around which the input and output signals swing. Output signals are in-phase with the input signals.

The OPA835 and OPA2835 devices are designed for the nominal value of  $R_F$  to be 2 k $\Omega$  in gains other than +1. This gives excellent distortion performance, maximum bandwidth, best flatness, and best pulse response.  $R_F = 2$  k $\Omega$  must be used as a default unless other design goals require changing to other values. All test circuits used to collect data for this data sheet had  $R_F = 2$  k $\Omega$  for all gains other than +1. A gain of +1 is a special case where  $R_F$  is shorted and  $R_G$  is left open.

#### 9.1.2 Inverting Amplifier

The OPA835 and OPA2835 devices can be used as inverting amplifiers with signal input to the inverting input,  $V_{IN-}$ , through the gain-setting resistor  $R_G$ . A basic block diagram of the circuit is shown in [Figure 54](#).

If  $V_{IN} = V_{REF} + V_{SIG}$ , the output of the amplifier may be calculated according to [Equation 2](#).

$$V_{OUT} = V_{SIG} \left( \frac{-R_F}{R_G} \right) + V_{REF} \quad (2)$$

$$G = \frac{-R_F}{R_G}$$

The signal gain of the circuit  $\frac{-R_F}{R_G}$  and  $V_{REF}$  provides a reference point around which the input and output signals swing. Output signals are 180° out-of-phase with the input signals. The nominal value of  $R_F$  must be 2 k $\Omega$  for inverting gains.

#### 9.1.3 Instrumentation Amplifier

[Figure 64](#) is an instrumentation amplifier that combines the high input impedance of the differential-to-differential amplifier circuit and the common-mode rejection of the differential-to-single-ended amplifier circuit. This circuit is often used in applications where high input impedance is required (such as taps from a differential line) or in cases where the signal source is a high impedance.

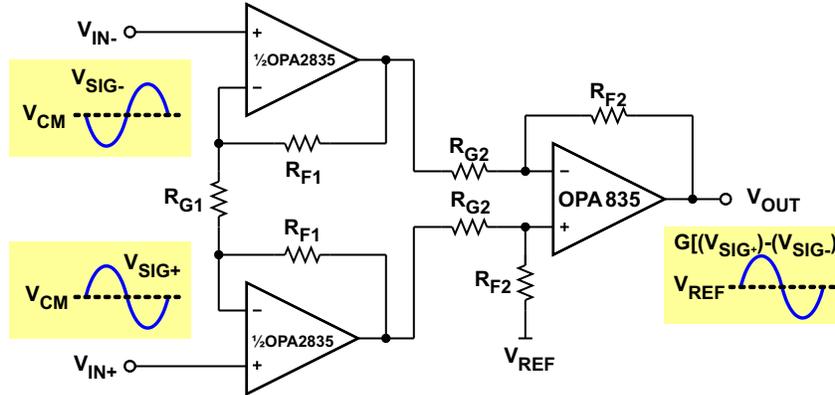

If  $V_{IN+} = V_{CM} + V_{SIG+}$  and  $V_{IN-} = V_{CM} + V_{SIG-}$ , the output of the amplifier may be calculated according to [Equation 3](#).

$$V_{OUT} = (V_{IN+} - V_{IN-}) \times \left( 1 + \frac{2R_{F1}}{R_{G1}} \right) \left( \frac{R_{F2}}{R_{G2}} \right) + V_{REF} \quad (3)$$

**Application Information (continued)**

$$G = \left( 1 + \frac{2R_{F1}}{R_{G1}} \right) \left( \frac{R_{F2}}{R_{G2}} \right)$$

The signal gain of the circuit is  $G$ .  $V_{CM}$  is rejected, and  $V_{REF}$  provides a level shift around which the output signal swings. The single-ended output signal is in-phase with the differential input signal.

**Figure 64. Instrumentation Amplifier**

Integrated solutions are available, but the OPA835 device provides a much lower-power, high-frequency solution. For best CMRR performance, resistors must be matched. A good rule of thumb is  $CMRR \approx$  the resistor tolerance; so 0.1% tolerance will provide approximately 60-dB CMRR.

**9.1.4 Attenuators**

The noninverting circuit shown in Figure 53 has a minimum gain of 1. To implement attenuation, a resistor divider can be placed in series with the positive input, and the amplifier set for a gain of 1 by shorting  $V_{OUT}$  to  $V_{IN-}$  and removing  $R_G$ . Because the op amp input is high impedance, the resistor divider sets the attenuation.

The inverting circuit of Figure 54 is used as an attenuator by making  $R_G$  larger than  $R_F$ . The attenuation is the resistor ratio. For example, a 10:1 attenuator can be implemented with  $R_F = 2\text{ k}\Omega$  and  $R_G = 20\text{ k}\Omega$ .

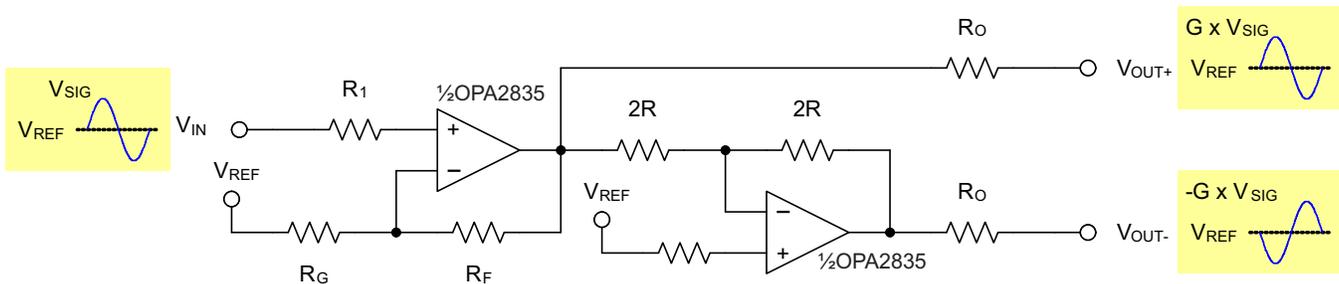

**9.1.5 Single-Ended to Differential Amplifier**

Figure 65 shows an amplifier circuit that converts single-ended signals to differential signals and provides gain and level shifting. This circuit can convert signals to differential in applications such as driving Cat5 cabling or driving differential-input SAR and  $\Delta\Sigma$  ADCs.

By setting  $V_{IN} = V_{REF} + V_{SIG}$ , then the output of the amplifier may be calculated according to Equation 4.

$$V_{OUT+} = G \times V_{IN} + V_{REF} \quad \text{and} \quad V_{OUT-} = -G \times V_{IN} + V_{REF} \quad \text{Where: } G = 1 + \frac{R_F}{R_G} \tag{4}$$

The differential-signal gain of the circuit is  $2 \times G$ , and  $V_{REF}$  provides a reference around which the output signal swings. The differential output signal is in-phase with the single-ended input signal.

**Figure 65. Single-Ended to Differential Amplifier**

### Application Information (continued)

Line termination on the output can be accomplished with resistors  $R_O$ . The differential impedance seen from the line will be  $2 \times R_O$ . For example, if 100- $\Omega$  Cat5 cable is used with double termination, the amplifier is typically set for a differential gain of 2 V/V (6 dB) with  $R_F = 0 \Omega$  (short)  $R_G = \infty \Omega$  (open),  $2R = 2 \text{ k}\Omega$ ,  $R_1 = 0 \Omega$ ,  $R = 1 \text{ k}\Omega$  to balance the input bias currents, and  $R_O = 49.9 \Omega$  for output line termination. This configuration is shown in Figure 66.

For driving a differential-input ADC the situation is similar, but the output resistors,  $R_O$ , are selected with a capacitor across the ADC input for optimum filtering and settling-time performance.

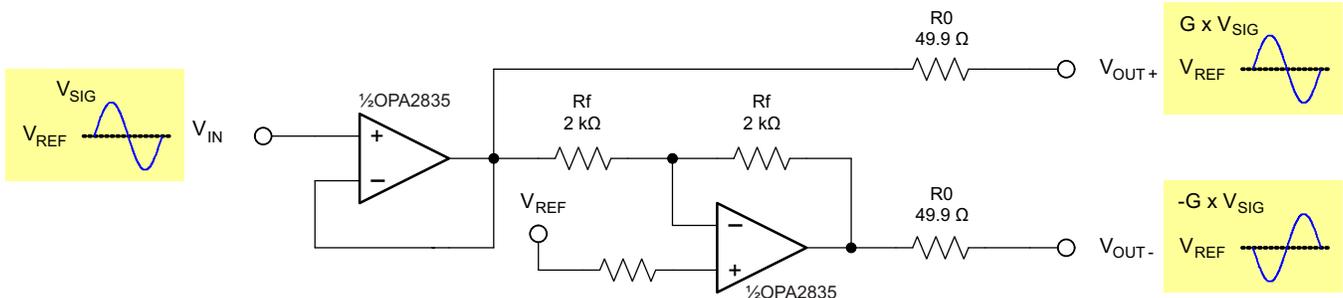

Figure 66. Cat5 Line Driver With Gain = 2 V/V (6 dB)

#### 9.1.6 Differential to Single-Ended Amplifier

Figure 67 shows a differential amplifier that converts differential signals to single-ended and provides gain (or attenuation) and level shifting. This circuit can be used in applications like a line receiver for converting a differential signal from a Cat5 cable to a single-ended signal.

If  $V_{IN+} = V_{CM} + V_{SIG+}$  and  $V_{IN-} = V_{CM} + V_{SIG-}$ , then the output of the amplifier may be calculated according to Equation 5.

$$V_{OUT} = (V_{IN+} - V_{IN-}) \times \left( \frac{R_F}{R_G} \right) + V_{REF} \quad (5)$$

$$G = \frac{R_F}{R_G}$$

The signal gain of the circuit is  $\frac{R_F}{R_G}$ ,  $V_{CM}$  is rejected, and  $V_{REF}$  provides a level shift around which the output signal swings. The single-ended output signal is in-phase with the differential input signal.

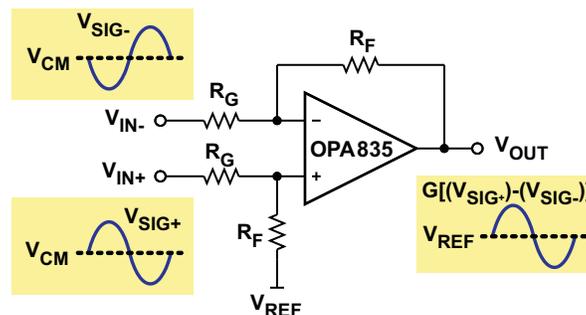

Figure 67. Differential to Single-Ended Amplifier

Line termination can be accomplished by adding a shunt resistor across the  $V_{IN+}$  and  $V_{IN-}$  inputs. The differential impedance is the shunt resistance in parallel with the input impedance of the amplifier circuit, which is usually much higher. For low gain and low line impedance, the resistor value to add is approximately the impedance of the line. For example, if a 100- $\Omega$  Cat5 cable is used with a gain of 1 amplifier and  $R_F = R_G = 2 \text{ k}\Omega$ , adding a 100- $\Omega$  shunt across the input will give a differential impedance of 99  $\Omega$ , which is adequate for most applications.

### Application Information (continued)

For best CMRR performance, resistors must be matched. Assuming CMRR  $\approx$  the resistor tolerance, a 0.1% tolerance will provide about 60-dB CMRR.

#### 9.1.7 Differential-to-Differential Amplifier

Figure 68 shows a differential amplifier that is used to amplify differential signals. This circuit has high input impedance and is used in differential line driver applications where the signal source is a high-impedance driver (for example, a differential DAC) that must drive a line.

If the user sets  $V_{IN\pm} = V_{CM} + V_{SIG\pm}$ , then the output of the amplifier may be calculated according to Equation 6.

$$V_{OUT\pm} = V_{IN\pm} \times \left( 1 + \frac{2R_F}{R_G} \right) + V_{CM} \tag{6}$$

$$G = 1 + \frac{2R_F}{R_G}$$

The signal gain of the circuit is  $\frac{2R_F}{R_G}$ , and  $V_{CM}$  passes with unity gain. The amplifier combines two noninverting amplifiers into one differential amplifier that shares the  $R_G$  resistor, which makes  $R_G$  effectively  $\frac{1}{2}$  its value when calculating the gain. The output signals are in-phase with the input signals.

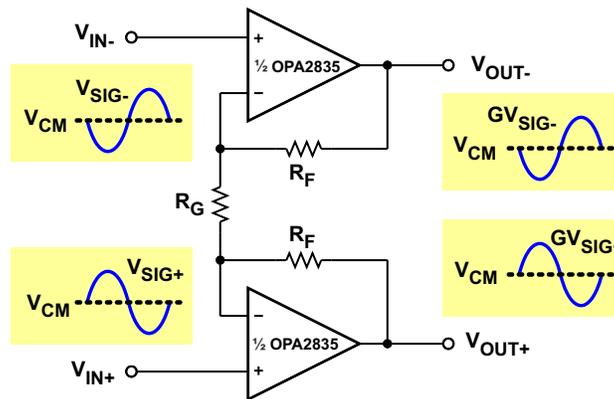

Figure 68. Differential-to-Differential Amplifier

#### 9.1.8 Gain Setting With OPA835 RUN Integrated Resistors

The OPA835 RUN package option includes integrated gain-setting resistors for the smallest possible footprint on a printed circuit board ( $\approx 2.00 \text{ mm} \times 2.00 \text{ mm}$ ). By adding circuit traces on the PCB, gains of +1, -1, -1.33, +2, +2.33, -3, +4, -4, +5, -5.33, +6.33, -7, +8 and inverting attenuations of -0.1429, -0.1875, -0.25, -0.33, -0.75 can be achieved.

Figure 69 shows a simplified view of how the OPA835IRUN integrated gain-setting network is implemented. Table 3 lists the required pin connections for various noninverting and inverting gains (reference Figure 53 and Figure 54). Table 4 lists the required pin connections for various attenuations using the inverting-amplifier architecture (reference Figure 54). Due to ESD protection devices being used on all pins, the absolute maximum and minimum input voltage range,  $V_{S-} - 0.7 \text{ V}$  to  $V_{S+} + 0.7 \text{ V}$ , applies to the gain-setting resistors, and so attenuation of large input voltages will require external resistors to implement.

The gain-setting resistors are laser trimmed to 1% tolerance with nominal values of 2.4 k $\Omega$ , 1.8 k $\Omega$ , and 600  $\Omega$ . The gain-setting resistors have excellent temperature coefficient, and gain tracking is superior to using external gain-setting resistors. The 800- $\Omega$  resistor and 1.25-pF capacitor in parallel with the 2.4-k $\Omega$  gain-setting resistor provide compensation for best stability and pulse response.

Application Information (continued)

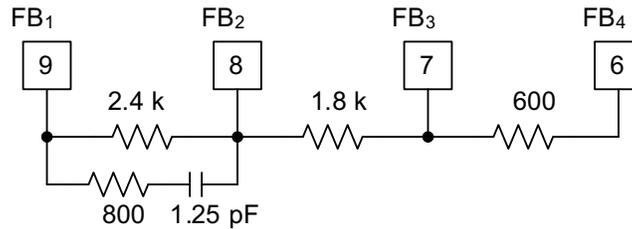

Figure 69. OPA835IRUN Gain-Setting Network

Table 3. Gain Settings

NONINVERTING GAIN (Figure 53)	INVERTING GAIN (Figure 54)	SHORT PINS	SHORT PINS	SHORT PINS	SHORT PINS
1 V/V (0 dB)	—	1 to 9			—
2 V/V (6.02 dB)	–1 V/V (0 dB)	1 to 9	2 to 8	6 to GND	—

9.1.9 Pulse Application With Single-Supply

For pulsed applications where the signal is at ground and pulses to a positive or negative voltage, the circuit bias-voltage considerations differ from those in an application with a signal that swings symmetrically about a reference point. Figure 70 shows a circuit where the signal is at ground (0 V) and pulses to a positive value.

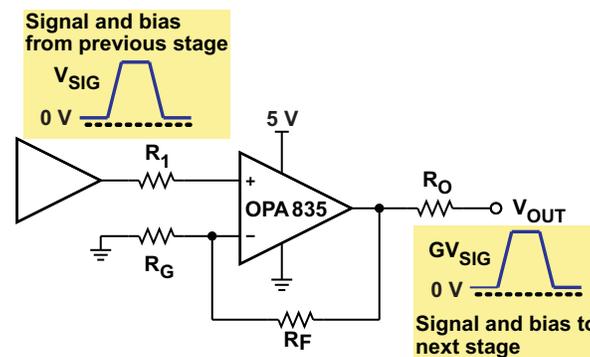

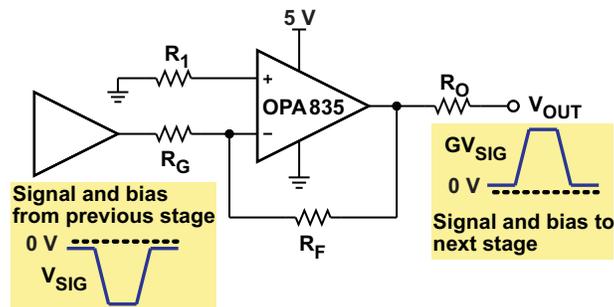

Figure 70. Noninverting Single Supply With Pulse

If the input signal pulses negative from ground, an inverting amplifier is more appropriate, as shown in [Figure 71](#). A key consideration in noninverting and inverting cases is that the input and output voltages are kept within the limits of the amplifier. Because the  $V_{ICR}$  of the OPA835 device includes the negative supply rail, the OPA835 op amp is well-suited for this application.

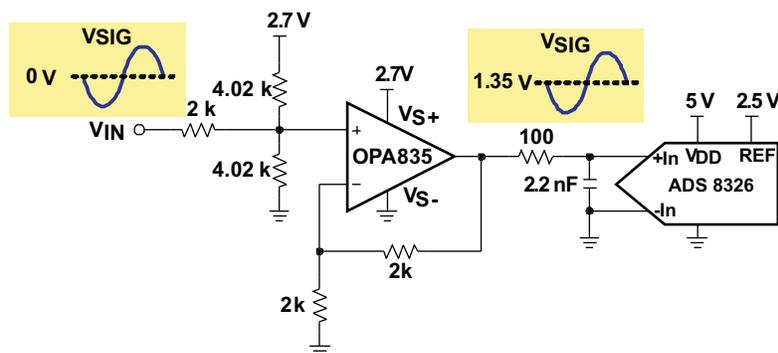

**Figure 71. Inverting Single Supply With Pulse**

### 9.1.10 ADC Driver Performance

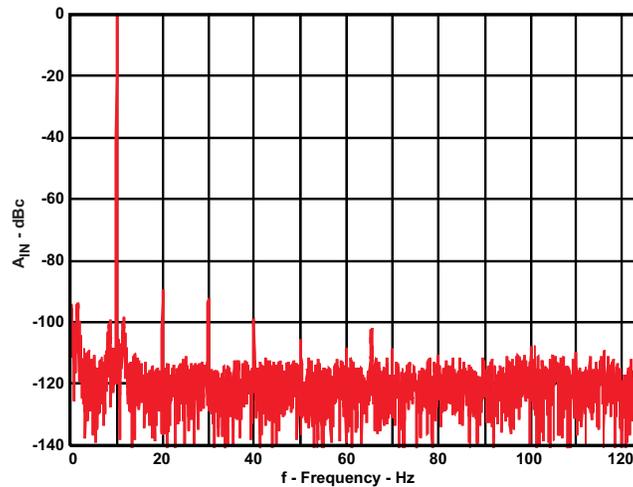

The OPA835 device provides excellent performance when driving high-performance delta-sigma ( $\Delta\Sigma$ ) and successive-approximation-register (SAR) ADCs in low-power audio and industrial applications.

To show achievable performance, the OPA835 device is tested as the drive amplifier for the ADS8326 device. The ADS8326 device is a 16-bit, micro power, SAR ADC with pseudodifferential inputs and sample rates up to 250 kSPS. The device offers excellent noise and distortion performance in a small 8-pin SOIC or VSSOP (MSOP) package. Low power and small size make the ADS8326 and OPA835 devices an ideal solution for portable and battery-operated systems, remote data-acquisition modules, simultaneous multichannel systems, and isolated data acquisition.

With the circuit shown in [Figure 72](#) to test the performance, [Figure 73](#) shows the spectral performance with a 10-kHz input frequency. The tabulated AC results are in [Table 5](#).

**Figure 72. OPA835 and ADS8326 Test Circuit**

**Figure 73. ADS8326 and OPA835 10-kHz FFT**

**Table 5. AC Analysis**

TONE (Hz)	SIGNAL (dBFS)	SNR (dBc)	THD (dBc)	SINAD (dBc)	SFDR (dBc)
10k	-0.85	81.9	-87.5	80.8	89.9

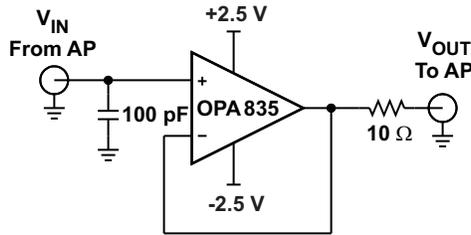

## 9.2 Typical Application

### 9.2.1 Audio Frequency Performance

The OPA835 and OPA2835 devices provide excellent audio performance with low quiescent power. To show performance in the audio band, an audio analyzer from Audio Precision (2700 series) tests THD+N and FFT at 1  $V_{RMS}$  output voltage.

## Typical Application (continued)

Figure 74 shows the test circuit used for the audio-frequency performance application.

The 100-pF capacitor to ground on the input helped to decouple noise pick up in the lab and improved noise performance.

**Figure 74. OPA835 Audio Precision Analyzer Test Circuit**

### 9.2.1.1 Design Requirements

Design a low distortion, single-ended input to single-ended output audio amplifier using the OPA835 device. The 2700 series audio analyzer from Audio Precision is the signal source and the measurement system.

**Table 6. Design Requirements**

CONFIGURATION	INPUT EXCITATION	PERFORMANCE TARGET	R <sub>LOAD</sub>
OPA835 Unity Gain Config.	1 KHz Tone Frequency	> 110 dBc SFDR	300 Ω and 100 KΩ

### 9.2.1.2 Detailed Design Procedure

The OPA835 device is tested in this application in a unity-gain buffer configuration. A buffer configuration is selected as the configuration maximizes the loop gain of the amplifier configuration. At higher closed-loop gains, the loop gain of the circuit reduces, which results in degraded harmonic distortion. The relationship between distortion and closed loop gain at a fixed input frequency can be seen in Figure 36 in *Typical Characteristics: V<sub>S</sub> = 5 V*. The test was performed under varying output-load conditions using a resistive load of 300 Ω and 100 KΩ. Figure 34 shows the distortion performance of the amplifier versus the output resistive load. Output loading, output swing, and closed-loop gain play a key role in determining the distortion performance of the amplifier.

#### NOTE

The 100-pF capacitor to ground on the input helped to decouple noise pickup in the lab and improved noise performance.

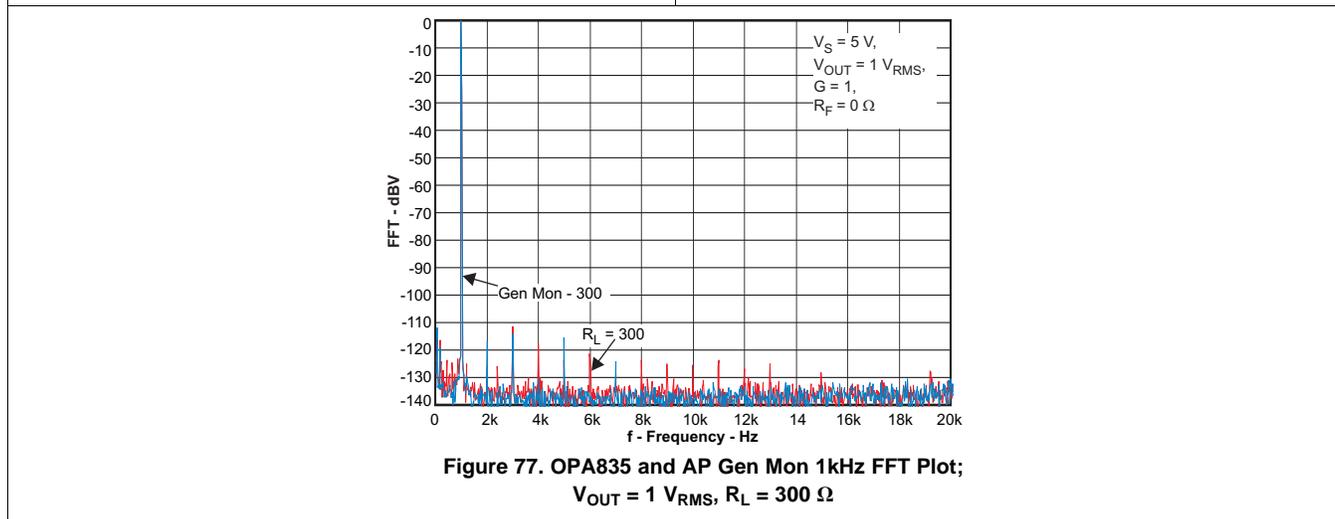

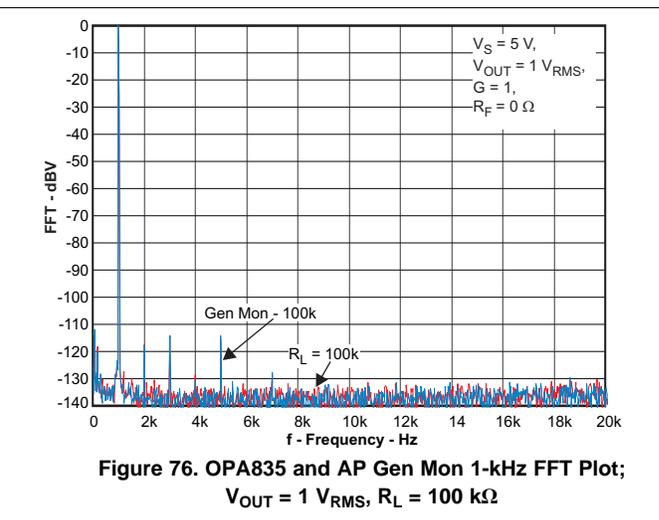

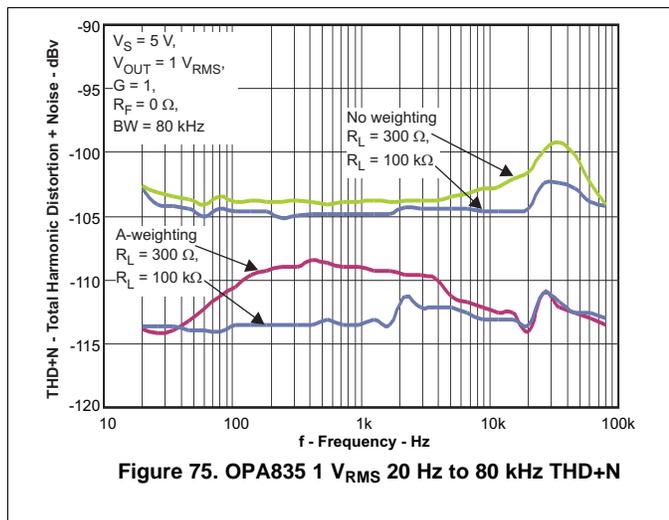

The Audio Precision was configured as a single-ended output in this application circuit. In applications where a differential output is available, the OPA835 device can be configured as a differential to single-ended amplifier as shown in Figure 67. Power supply bypassing is critical to reject noise from the power supplies. A 2.2-μF power-supply decoupling capacitor must be placed within two inches of the device and can be shared with other op amps on the same board. A 0.1-μF decoupling capacitor must be placed as close to the power supply pins as possible, preferably within 0.1 inch. For split supply, a capacitor is required for both supplies. A 0.1-μF capacitor placed directly between the supplies is also beneficial for improving system noise performance. If the output load is heavy, from 16 Ω to 32 Ω, amplifier performance could begin to degrade. To drive such heavy loads, both channels of the OPA2835 device can be paralleled with the outputs isolated with 1-Ω resistors to reduce the loading effects.

### 9.2.1.3 Application Curves

A 10-Ω series resistor can be inserted between the capacitor and the noninverting pin to isolate the capacitance.

Figure 75 shows the THD+N performance with 100-kΩ and 300-Ω loads, and with no weighting and A-weighting. With no weighting, the THD+N performance is dominated by the noise for both loads. A-weighting provides filtering that improves the noise so a larger difference can be seen between the loads due to more distortion with  $R_L = 300 \Omega$ .

Figure 76 and Figure 77 show FFT output with a 1-kHz tone and 100-kΩ and 300-Ω loads. To show relative performance of the device versus the test set, one channel has the OPA835 device in-line between generator output and analyzer input, and the other channel is in “Gen Mon” loopback mode, which internally connects the signal generator to the analyzer input. With 100-kΩ load (see Figure 76), the curves are indistinguishable from each other except for noise, which means the OPA835 device cannot be directly measured. With a 300-Ω load as shown in Figure 77, the main difference between the curves is the OPA835 device due to the higher even-order harmonics. The test-set performance masks the odd-order harmonics.

### 9.2.2 Active Filters

The OPA835 and OPA2835 devices are good choices for active filters. [Figure 79](#) and [Figure 78](#) show MFB and Sallen-Key circuits designed using the [WEBENCH® Filter Designer](#) to implement second-order low-pass Butterworth filter circuits. [Figure 80](#) shows the frequency response.

Other MFB and Sallen-Key filter circuits display similar performance. The main difference is the MFB is an inverting amplifier in the pass band and the Sallen-Key is noninverting. The primary advantage for each is the Sallen-Key in unity gain has no resistor gain error term, and thus no sensitivity to gain error, while the MFB has better attenuation properties beyond the bandwidth of the op amp.

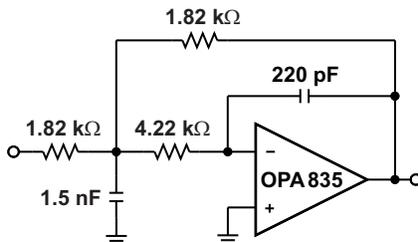

Figure 78. MFB 100-kHz Second-Order Low-Pass Butterworth Filter Circuit

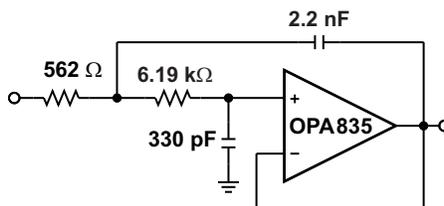

Figure 79. Sallen-Key 100-kHz Second-Order Low-Pass Butterworth Filter Circuit

#### 9.2.2.1 Application Curve

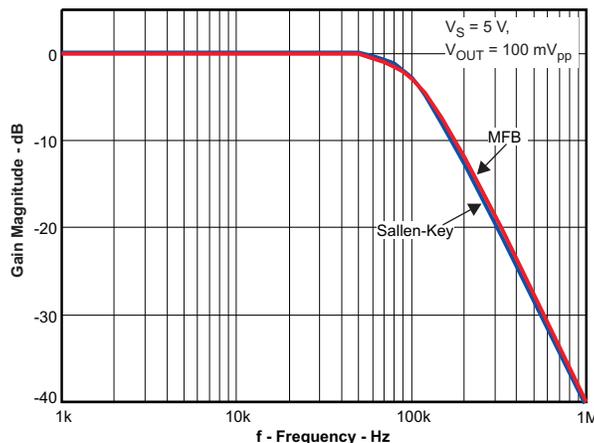

Figure 80. MFB and Sallen-Key Second-Order Low-Pass Butterworth Filter Response

## 10 Power Supply Recommendations

The OPAx835 devices are intended to work in a supply range of 2.7 V to 5 V. Supply-voltage tolerances are supported with the specified operating range of 2.5 V (7% on a 2.7-V supply) and 5.5 V (10% on a 5-V supply). Good power-supply bypassing is required. Minimize the distance (< 0.1 inch) from the power-supply pins to high frequency, 0.1- $\mu$ F decoupling capacitors. A larger capacitor (2.2  $\mu$ F is typical) is used along with a high frequency, 0.1- $\mu$ F supply-decoupling capacitor at the device supply pins. For single-supply operation, only the positive supply has these capacitors. When a split supply is used, use these capacitors for each supply to ground. If necessary, place the larger capacitors further from the device and share these capacitors among several devices in the same area of the PCB. Avoid narrow power and ground traces to minimize inductance between the pins and the decoupling capacitors. An optional supply decoupling capacitor across the two power supplies (for bipolar operation) reduces second harmonic distortion.

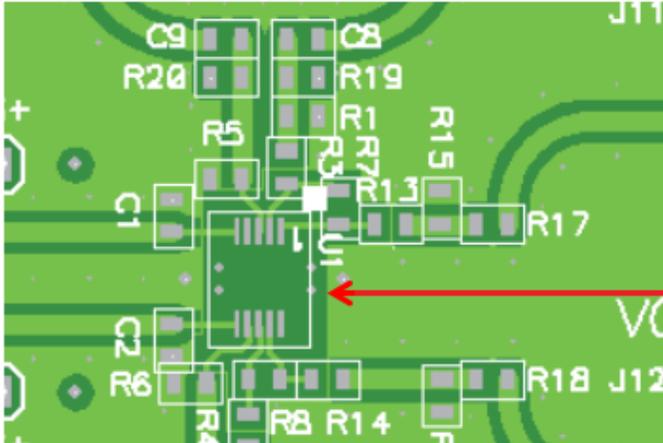

## 11 Layout

### 11.1 Layout Guidelines

The [OPA835 EVM](#) (SLOU314) can be used as a reference when designing the circuit board. TI recommends following the EVM layout of the external components near to the amplifier, ground plane construction, and power routing as closely as possible. General guidelines are listed below:

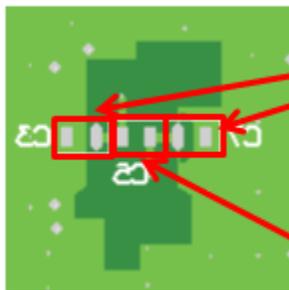

1. Signal routing must be direct and as short as possible into an out of the op amp.
2. The feedback path must be short and direct avoiding vias if possible, especially with  $G = +1$ .
3. Ground or power planes must be removed from directly under the negative input and output pins of the amplifier.
4. TI recommends placing a series output resistor as close to the output pin as possible. See [Figure 41](#) for recommended values for the expected capacitive load.
5. A 2.2- $\mu$ F power-supply decoupling capacitor must be placed within two inches of the device and can be shared with other op amps. For split supply, a capacitor is required for both supplies.
6. A 0.1- $\mu$ F power-supply decoupling capacitor must be placed as close to the supply pins as possible, preferably within 0.1 inch. For split supply, a capacitor is required for both supplies.
7. The  $\overline{\text{PD}}$  pin uses TTL logic levels. If the pin is not used, it must tied to the positive supply to enable the amplifier. If the pin is used, it must be actively driven. A bypass capacitor is not necessary, but is used for robustness in noisy environments.

## 11.2 Layout Example

Dark green areas indicate regions of the PCB where the underlying Ground and Power Planes have been removed in order to minimize parasitic capacitance on the sensitive input and output nodes.

**Figure 81. Top Layer**

C3 and C7 are 0.1- $\mu$ F bypass capacitors placed directly underneath the device power supply pins.

C5 is a bypass capacitor between the supply pins. Use this when configuring the amplifier with bipolar supplies to improve HD2 performance.

**Figure 82. Bottom Layer**

## 12 Device and Documentation Support

### 12.1 Device Support

#### 12.1.1 Development Support

[WEBENCH® Filter Designer](#)

### 12.2 Documentation Support

#### 12.2.1 Related Documentation

For related documentation see the following:

[OPA835DBV](#), [OPA836DBV EVM](#) (SLOU314).

#### 12.2.2 Related Links

[Table 7](#) lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

**Table 7. Related Links**

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

---

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

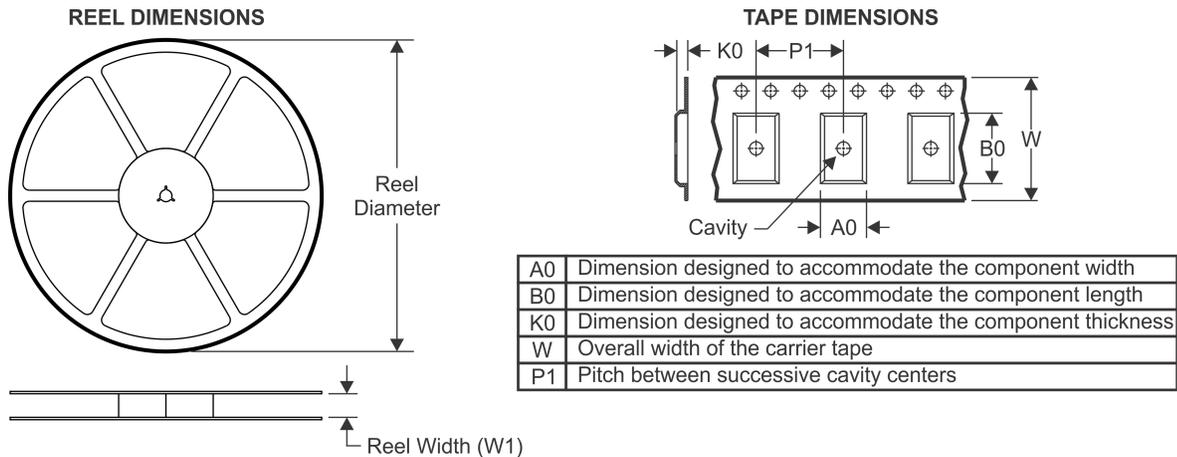

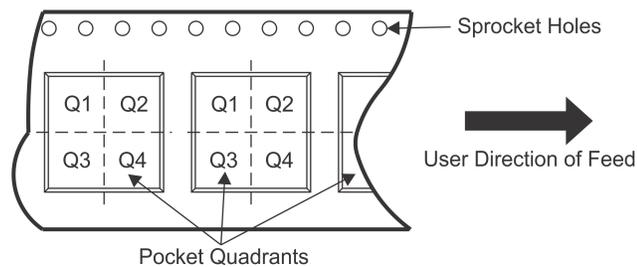

<sup>(4)</sup> There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

<sup>(5)</sup> Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

<sup>(6)</sup> Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

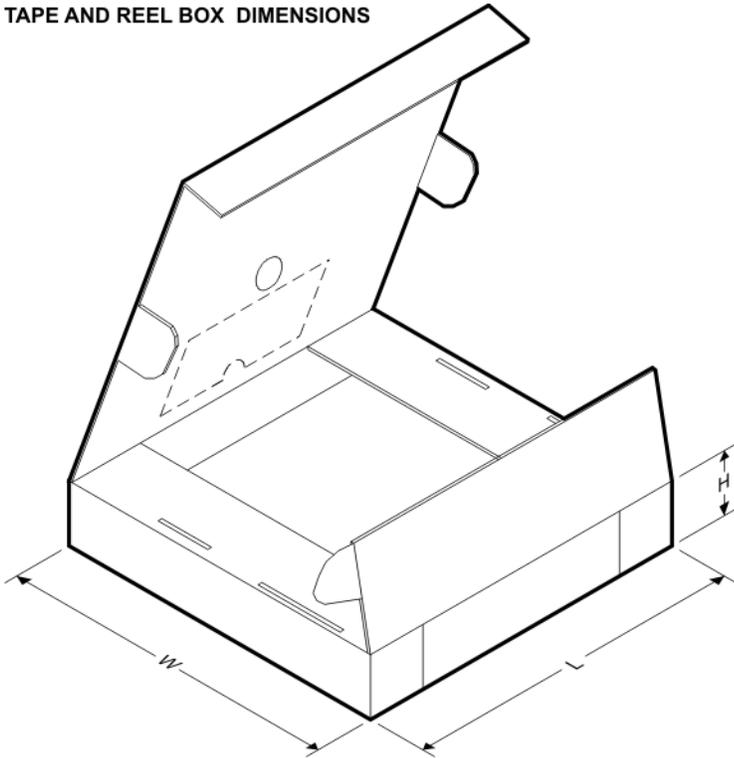

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties.   - E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
