

TPIC2603 6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

- Serial Control With Diagnostics
- Six Power DMOS Transistor Outputs of 350-mA Continuous Current
- Internal 60-V Inductive Load Clamp
- Independent ON-State Shorted-Load/Short-to-Battery Fault Detection on All Drain Terminals
- Independent OFF-State Open-Load Fault Sense on All Drain Terminals
- Transition of Drain Outputs to Low Duty Cycle Pulsed-Width-Modulation (PWM) Mode for Over-Current Condition
- Over-Battery-Voltage-Lockout Protection
- Over-Temperature Sense With Serial Interface Fault Status
- Fault Diagnostics Returned Through Serial Output Terminal
- Internal Power-On Reset of Registers
- CMOS Compatible Inputs With Hysteresis

description

The TPIC2603 is a monolithic low-side driver which provides serial interface and diagnostics to control six on-board power DMOS switches. Each channel has independent OFF-state open-load sense, ON-state shorted-load/short-to-battery protection, over-battery-voltage-lockout protection, and over-temperature sense with fault status reported through the serial interface. The device also provides inductive voltage transient protection for each drain output. The TPIC2603 drives inductive and resistive loads such as relays, valves, and lamps.

Serial data input (SDI) is transferred through the serial register when $\overline{CS}$ is low on low-to-high transitions of the serial clock (SCLK). Each string of data must consist of 8 or 16 bits of data. A logic high input data bit turns the respective output channel ON and a logic low data bit turns it OFF. $\overline{CS}$ must be transitioned high after all of the serial data has been clocked into the device. A low-to-high transition of $\overline{CS}$ transfers the last six bits of serial data to the output buffer, places the serial data out (SDO) terminal in a high-impedance state, and re-enables the fault register. Fault data for the device is sent out the SDO terminal. The first bit of the shift register is exclusively ORed with the fault registers. When a fault exists, the SDI data is inverted as it is transferred out of SDO. Fault data consists of fault flags for over-temperature (bit 6) and shorted/open-load (bits 0-5) for each of the six output channels. Fault register bits are set or cleared asynchronously, when $\overline{CS}$ is high to reflect the current state of the hardware. The fault must be present when $\overline{CS}$ is transitioned from high to low to be captured and reported in the serial fault data. New faults cannot be captured in the serial register when $\overline{CS}$ is low.

TPIC2603

6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

description (continued)

When an over-current or shorted-load fault occurs, the channel transits into a low duty cycle pulse-width-modulated (PWM) signal as long as the fault is present. More detail on fault detection operation is presented in the device operation section of this data sheet.

The TPIC2603 provides pulldown resistors on all active-high inputs except SCLK. A pullup resistor is used on $\overline{\text{CS}}$.

The TPIC2603 is characterized for operation over the operating case temperature of -40°C to 125°C .

TPIC2603

6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

Terminal Functions

TERMINAL NAME	NO. [†]	I/O	DESCRIPTION
$\overline{\text{CS}}$	8 (10)	I	Chip select. The $\overline{\text{CS}}$ is an active-low input used to select the serial interface of the device. The device accepts serial input data and transmits fault data when $\overline{\text{CS}}$ is held low. An internal pullup resistor is provided on the $\overline{\text{CS}}$ input.
DRAIN0 DRAIN1 DRAIN2 DRAIN3 DRAIN4 DRAIN5	19 (23) 12 (14) 10 (12) 9 (11) 2 (2) 1 (1)	O	FET drain outputs. The DRAIN terminals are low-side switches for inductive and resistive loads. Each output provides an internal drain-gate clamp to snub inductive transients.
GND	5, 6, 15, 16 (5, 6, 7, 8, 17, 18, 19, 20)	O	Ground. These terminals provide ground return paths for the device.
SCLK	3 (3)	I	Serial clock. The SCLK clocks the shift register. Serial data is transferred into the SDI port and serial fault data is transferred out of the SDO port of the device on the rising edges of SCLK.
SDI	4 (4)	I	Serial data input. The device receives serial data from the control device using the SDI. Serial input data can be configured in 8-bit or 16-bit data words. Refer to Figures 2 and 4 for input protocol. An internal pulldown resistor is provided on the SDI input.
SDO	7 (9)	O	Serial data output. This 3-state output transfers fault data to the control device after the device has been selected by the $\overline{\text{CS}}$ terminal.
V _{bat}	20 (24)	I	Battery voltage. The V _{bat} terminal monitors the battery voltage to detect over-voltage conditions.
V _{CC}	11 (13)	I	Supply voltage. The V _{CC} terminal receives a 5-V supply for internal logic.

[†] Terminal numbers listed in parenthesis are for the 24-pin DW package.

absolute maximum ratings over the recommended operating case temperature range (unless otherwise noted)[‡]

Logic supply voltage range, V _{CC} (see Note 1)	–0.3 V to 7 V
Battery supply voltage range, V _{bat}	–1.5 V to 60 V
Logic input voltage range, V _I	–0.3 V to 7 V
Power DMOS drain-to-source voltage, V _{DS} (see Note 2)	68 V
Continuous drain current, each output, all outputs on, I _D , T _C = 25°C	350 mA
Pulsed drain current, single output, I _{DM} , T _C = 25°C (see Note 3)	2.25 A
Single-pulse avalanche energy, E _{AS} (see Figure 11)	100 mJ
Continuous total power dissipation	See Dissipation Rating Table
Avalanche current, I _{AS} (see Note 4)	1 A
Operating virtual junction temperature range, T _J	–40°C to 150°C
Storage temperature range, T _{stg}	–55°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

[‡] Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES:
1. All voltage values are with respect to GND.
 2. Each power DMOS source is internally connected to GND.
 3. Pulse duration ≤ 100 μs and duty cycle ≤ 2%.
 4. DRAIN supply voltage = 13 V, starting junction temperature (T_{JS}) = 25°C, L = 150 mH, I_{AS} = 1 A (see Figure 11).

TPIC2603

6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

PRINCIPLES OF OPERATION

Figure 1. Switching Characteristics

serial interface

Control information is transferred into the TPIC2603 through the serial interface. The serial interface consists of a serial clock (SCLK), chip select ($\overline{\text{CS}}$), serial data input (SDI), and serial data output (SDO). Serial data is shifted, most significant bit (MSB) first, into the SDI shift register on the rising edge of the first SCLK after $\overline{\text{CS}}$ has transitioned from high to low. The controller must shift either eight bits or sixteen bits of data into the device with the last six bits of input data containing control information for the output drivers. Data bits preceding the output control information should be set to 0. A low-to-high transition on $\overline{\text{CS}}$ latches the contents of the last six bits of the serial shift register into the output buffer. A low input to SDI turns the corresponding parallel output OFF and a high input will turn the output ON (see Figure 2).

Figure 2. Serial Input Control

PRINCIPLES OF OPERATION

serial interface (continued)

Fault isolation data for each channel and global over-temperature status is transferred to the control device using the serial interface. Fault status for the TPIC2603 is captured as $\overline{CS}$ transits low. The fault interface monitors the SDI terminal and exclusively ORs the respective input control bit with the corresponding fault information bit stored in the fault register. Each exclusive ORed fault bit is transferred out the SDO terminal on the rising edge of the SCLK. Serial data can be transferred in 8-bit or 16-bit words as illustrated in Figure 4, with fault data appearing in the first 8-bits of serial output data. The $\overline{CS}$ must be transited high after the serial transfer has completely latched the new control data into the output control buffer and re-enable fault reporting on the device (see Figures 3 and 4).

NOTE A: MSB is the first bit transferred.

Figure 3. Serial Output Control

TPIC2603
6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

PRINCIPLES OF OPERATION

serial interface (continued)

NOTE A: MSB is the first bit transferred.

Figure 4. Serial Data Fault Protocol

PRINCIPLES OF OPERATION

fault sense/protection circuitry

over-current/short-to-battery sensing and protection

The internal fault protection circuitry of the TPIC2603 monitors the drain current for each channel. Each channel offers two levels of protection from over-current conditions. The first level is a current-limit protection which through the internal FET prevents the switching current from exceeding the on-state current limit. The second level of protection transits the output to a low duty cycle PWM mode when the current exceeds the over-current sense threshold. The PWM mode protection is enabled approximately 70 μ s after the output has been turned on. The output remains in the PWM mode until the shorted-load condition has been corrected and then automatically returns to normal operation. Figure 5 illustrates device operation under an over-current or shorted-load condition.

NORMAL

SHORTED-LOAD

Figure 5. Shorted-Load Condition

TPIC2603

6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

PRINCIPLES OF OPERATION

open-load/short-to-ground sensing

The TPIC2603 checks for open-load and short-to-ground conditions when the output is turned OFF. When the output turns OFF, a 40- μ A current source switches onto the drain. Under normal conditions, the load provides adequate current to overcome the current source and the drain voltage remains above the open-load detection threshold. When the output is open, then the current source pulls the drain low and an open-load condition is flagged. The open-load test is enabled approximately 70 μ s after the output turns OFF to allow the drain to stabilize. Figure 6 illustrates device operation under open-load conditions.

Figure 6. Open-Load Condition

over-voltage sensing and protection

The TPIC2603 monitors the V_{bat} input terminal to protect the device and load from over-battery voltage conditions. The device disables all of the drain outputs when V_{bat} goes above 35 V. An over-battery voltage hysteresis is provided to prevent the outputs from transiting ON and OFF erratically near the over-voltage threshold. The device automatically returns to normal operation after the over-voltage condition has been corrected. Figure 7 illustrates device operation under an over-battery voltage condition.

Figure 7. Over-Battery Voltage Condition

PRINCIPLES OF OPERATION

over-temperature sensing

The TPIC2603 monitors the junction temperature of the die to detect over-temperature conditions which may damage the device. When the junction temperature goes above approximately 170°C, the fault logic sets the global over-temperature fault bit. An over-temperature fault is reported using the serial interface on bit 6 (for 8-bit configuration) or bit 14 (for 16-bit configuration). The global over-temperature fault output in the serial data is exclusively ORed with the second bit (bit 6 for 8-bit configuration or bit 14 for 16-bit configuration) of data input to the SDI terminal. Bit 6 or bit 14 of the input data should be set low. Over-temperature faults are for informational purposes only and do not affect the state of the drains. Figure 8 illustrates device operation under over-temperature conditions.

Figure 8. Over-Temperature Sense

PARAMETER MEASUREMENT INFORMATION

- NOTES:
- A. Region 1 – Analog current limit holds the maximum current while the device runs in chop mode.
 - B. Region 2 – Analog current limit is removed but device continues in chop mode.
 - C. Region 3 – Current is below chop mode sense; therefore, it is in normal operation. Variable load is resistance over time.

Figure 9. Chopping-Mode Characteristics

PARAMETER MEASUREMENT INFORMATION

Figure 10

SINGLE-PULSE AVALANCHE ENERGY TEST CIRCUIT

VOLTAGE AND CURRENT WAVEFORMS

† Non-JEDEC symbol for avalanche time.

NOTES: A. The word generator has the following characteristics: $t_r \leq 10$ ns, $t_f \leq 10$ ns, $Z_O = 50 \Omega$.

B. Input pulse duration, t_w , is increased until peak current $I_{AS} = 1$ A.

Energy test level is defined as $E_{AS} = (I_{AS} \times V(BR)DSX \times t_{av})/2 = 100$ mJ.

TPIC2603

6-CHANNEL SERIAL INTERFACE LOW-SIDE DRIVER

SLIS056A – FEBRUARY 1995 – REVISED MARCH 1996

THERMAL INFORMATION

The single-pulse curve represents measured data. The curves for various pulse durations are based on the following equation:

$$Z_{\theta JA} = \left| \frac{t_w}{t_c} \right| R_{\theta JA} + \left| 1 - \frac{t_w}{t_c} \right| Z_{\theta}(t_w + t_c) + Z_{\theta}(t_w) - Z_{\theta}(t_c)$$

Where:

$Z_{\theta}(t_w)$ = the single-pulse thermal impedance for $t = t_w$ seconds

$Z_{\theta}(t_c)$ = the single-pulse thermal impedance for $t = t_c$ seconds

$Z_{\theta}(t_w + t_c)$ = the single-pulse thermal impedance for $t = t_w + t_c$ seconds

$$d = t_w/t_c$$

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
