20-W STEREO DIGITAL AUDIO POWER AMPLIFIER

Check for Samples: TAS5701

FEATURES

- **Audio Input/Output**
  - **20-W Into an 8-Ω Load From an 18-V Supply**
  - **Wide PVDD Range (0 V to 21 V)**
  - **Efficient Class-D Operation Eliminates Need for Heat Sinks**
  - **Two Serial Audio Inputs (3 Audio channels)**
  - **Supports 32-kHz to 192-kHz Sample Rates (LJ/RJ/I²S)**
  - **Line-Level Subwoofer PWM Outputs**
- **Audio/PWM Processing**
  - **BD (Filter-free) Modulation Supporting Bridge-Tied Loads ONLY**
  - **4-Step Volume Control (0 dB, 6 dB, 12 dB, 18 dB)**
    - **All Channels Share Same Control**
  - **Soft Mute (50% Duty Cycle)**
  - **DC Blocking Filters**
  - **Fixed Maximum Modulation Limit At 97.7%**
  - **≥100-dB SNR – Measured at Maximum Output With THD+N = 1%, 1 kHz, A-Weighted Noise, Gain = 0 dB**
  - **THD < 0.1% at 1/2 Rated Power**

- **General Features**
  - **5-V Tolerant Inputs (See pin list for details on which inputs are 5-V tolerant)**
  - **Shutdown Mode for Low Power Consumption**
  - **Thermal and Short-Circuit Protection**
  - **Autodetect: Automatically Detect Sample-Rate Changes – No Need for External Microprocessor Intervention**

DESCRIPTION

The TAS5701 is a 20-W efficient, digital audio power amplifier for driving stereo bridge-tied speakers. Two serial data inputs support up to 3 discrete audio channels. The SDIN1 input is routed to the internal left and right outputs. The SDIN2 input is dedicated to the SUB_PWM± outputs.

The TAS5701 is a clock slave-only device receiving clocks from external sources. The TAS5701 operates at a 384-kHz switching rate for 32-, 48-, 96-, and 192-kHz data and 352.8-kHz switching rate 44.1-,88.2-, and 176.4-kHz data. The 8× oversampling combined with the fourth-order noise shaper provides a flat noise floor and excellent dynamic range from 20 Hz to 20 kHz.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

PIN FUNCTIONS

PIN		I/O[1]	5-V TOLERANT	TERMINATION [2] [3]	DESCRIPTION
NAME	NO.				
AVDD	10	P			3.3-V Analog power supply
AVSS	11	P			Analog 3.3-V supply ground
BKND_ERR	37	DI		Pullup	Active low. A back-end error sequence is initiated by applying a logic low to this pin. Connect to an external power stage. If no external power stage is used, connect directly to DVDD.
BST_A	4	P			High-side bootstrap supply for half-bridge A
BST_B	57	P			High-side bootstrap supply for half-bridge B
BST_C	56	P			High-side bootstrap supply for half-bridge C

(1) TYPE: A = analog; D = 3.3-V digital; P = power/ground/decoupling; I = input; O = output
(2) All pullups are 20-µA *weak* pullups and all pulldowns are 20-µA *weak* pulldowns. The pullups and pulldowns are included to assure proper input logic levels if the terminals are left unconnected (pullups → logic 1 input; pulldowns → logic 0 input). Devices that drive inputs with pullups must be able to sink 50 µA while maintaining a logic-0 drive level. Devices that drive inputs with pulldowns must be able to source 50 µA while maintaining a logic-1 drive level.
(3) If desired, low-ESR capacitance values can be implemented by paralleling two or more ceramic capacitors of equal value. Paralleling capacitors of equal value provides an extended high-frequency supply decoupling. This approach avoids the potential of producing parallel resonance circuits that have been observed when paralleling capacitors of different values.

TAS5701

PIN FUNCTIONS (continued)

PIN NAME	PIN NO.	I/O[1]	5-V TOLERANT	TERMINATION [2] [3]	DESCRIPTION
BST_D	45	P			High-side bootstrap supply for half-bridge D
CONFIG_2	33	P		Pulldown	Input/output configuration. Connect this terminal directly to GND.
CONFIG_1	34	P		Pulldown	Input/output configuration. Connect this terminal directly to DVDD.
DVDD	15, 35	P			3.3-V Digital power supply
DVSS	26	P			Digital ground
DVSSO	20	P			Oscillator ground
FAULT	9	DO			Overtemperature, undervoltage, and overcurrent fault reporting. Active low indicates fault. If high, normal operation.
FORMAT2	30	DI		Pulldown	Digital data format select MSB.
FORMAT1	31	DI		Pulldown	Digital data format select LSB.
FORMAT0	32	DI		Pulldown	Digital data format select.
GAIN_1	28	DI	5-V		MSB of gain select.
GAIN_0	29	DI	5-V		LSB of gain select. GAIN_0 and GAIN_1 allow 4 possible gain selections.
GND	41, 42	P			Analog ground for power stage.
GVDD_AB	5	P			Gate drive voltage for half-bridges A and B (10.8 V to 13.2 V)
GVDD_CD	44	P			Gate drive voltage for half-bridges C and D (10.8 V to 13.2 V)
LRCLK	22	DI	5-V		Input serial audio data left/right clock (sampling rate clock)
MCLK	36	DI	5-V		Clock master input. The input frequency of this clock can range from 4.9 MHz to 49 MHz.
MUTE	21	DI	5-V	Pullup	Performs a soft mute of outputs, active-low. A logic low on this pin sets the outputs equal to 50% duty cycle. A logic high on this pin allows normal operation. The mute control provides a noiseless volume ramp to silence. Releasing mute provides a noiseless ramp to previous volume.
OC_ADJ	8	AO			Analog overcurrent programming. Requires 22-kΩ resistor to ground.
OSC_RES	19	AO			Oscillator trim resistor. Connect an 18.2-kΩ (1% tolerance is required) resistor to DVSSO.
OUT_A	1, 64	O			Output, half-bridge A
OUT_B	60, 61	O			Output, half-bridge B
OUT_C	52, 53	O			Output, half-bridge C
OUT_D	48, 49	O			Output, half-bridge D
PDN	17	DI	5-V	Pullup	Power down, active-low. PDN stops all clocks, and outputs stop switching whenever a logic low is applied. When PDN is released, the device powers up all logic, starts all clocks, and performs a soft start that returns to the previous configuration changes to FORMATx and GAINx pins are ignored on PDN cycling.
PGND_AB	62, 63	P			Power ground for half-bridges A and B
PGND_CD	50, 51	P			Power ground for half-bridges C and D
PLL_FLTM	12	AO			PLL negative loop filter terminal
PLL_FLTP	13	AI			PLL positive loop filter terminal
PVDD_A	2, 3	P			Power supply input for half-bridge output A (0 V–21 V)
PVDD_B	58, 59	P			Power supply input for half-bridge output B (0 V–21 V)
PVDD_C	54, 55	P			Power supply input for half-bridge output C (0 V–21 V)
PVDD_D	46, 47	P			Power supply input for half-bridge output D(0 V–21 V)
RESET	16	DI	5-V	Pullup	Reset, active-low. A system reset is generated by applying a logic low to this terminal. RESET is an asynchronous control signal that sets the VALID outputs low, and places the PWM in the hard mute state (stop switching). Gain is immediately set to full attenuation. Upon the release of RESET, if PDN is high, the system performs a 4-ms to 5-ms device initialization and sets the gain and format to the settings determined by the hardware pins.

PIN FUNCTIONS (continued)

PIN		I/O[1]	5-V TOLERANT	TERMINATION [2] [3]	DESCRIPTION
NAME	NO.				
SCLK	23	DI	5-V		Serial audio data clock (shift clock). SCLK is the serial audio port input data bit clock.
SDIN1	25	DI	5-V		Serial audio data 1 input is one of the serial data input ports. SDIN1 supports three discrete (stereo) data formats.
SDIN2	24	DI	5-V		Serial audio data 2 input is one of the serial data input ports. SDIN2 supports three discrete (stereo) data formats.
SUB_PWM–	39	DO			Subwoofer negative PWM output. BD modulated signal.
SUB_PWM+	40	DO			Subwoofer positive PWM output. BD modulated signal.
TEST1	7	DI			Test pin. Connect directly to GND.
VALID	38	DO			Output indicating validity of ALL PWM channels, active-high. This pin is connected to an external power stage. If no external power stage is used, leave this pin floating.
VDD	6	P			Power supply for VREG (10.8 V to 13.2 V)
VR_ANA	14	P			Internally regulated 1.8-V analog supply voltage. This terminal must not be used to power external devices.
VR_DIG	27	P			Internally regulated 1.8-V analog supply voltage. This terminal must not be used to power external devices.
VREG	43	P			Digital regulator output. Not to be used for powering external circuitry.
VREG_EN	18	DI		Pulldown	Voltage regulator enable. Connect directly to GND.

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) [1]

		VALUE	UNIT
Supply voltage	GVDD, VDD	−0.3 to 13.2	V
	PVDD	−0.3 to 23	
	DVDD	−0.3 to 3.6	
	AVDD	−0.3 to 3.6	
	OUT_X to GND_X	−0.3 to 30	
	BST_X to GND_X	−0.3 to 43.2	
Input voltage	3.3-V digital input	−0.5 to DVDD + 0.5	V
	5-V tolerant[2] digital input	−0.5 to DVDD + 2.5	
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > 1.8$ V)		±20	mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > 1.8$ V)		±20	mA
Operating free-air temperature		0 to 85	°C
Operating junction temperature range		0 to 150	°C
Storage temperature range, T_{stg}		−40 to 125	°C

(1) Stresses beyond those listed under *absolute ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operation conditions* are not implied. Exposure to absolute-maximum conditions for extended periods may affect device reliability.
(2) 5-V tolerant inputs are PDN, RESET, MUTE, SCLK, LRCLK, MCLK, SDIN1, SDIN2.

DETAILED DESCRIPTION

POWER SUPPLY

The digital portion of the chip requires 3.3 V, and the analog portion can work with a variable range up to 12 V. PVDD has a maximum operational range up to 22 V.

To facilitate system design, the TAS5701 needs only a 12-V supply in addition to the (typical) 18-V power-stage supply. An internal voltage regulator provides suitable voltage levels for the digital and low-voltage analog circuitry. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors.

In order to provide outstanding electrical and acoustical characteristics, the PWM signal path including gate drive and output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate gate drive supply (GVDD_X), bootstrap pins (BST_X), and power-stage supply pins (PVDD_X). Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power supply pins and decoupling capacitors must be avoided.

For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_X) to the power-stage output pin (OUT_X). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive power-supply pin (GVDD_X) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver. In an application with PWM switching frequencies in the range from 352 kHz to 384 kHz, it is recommended to use 33-nF ceramic capacitors, size 0603 or 0805, for the bootstrap supply. These 33-nF capacitors ensure sufficient energy storage, even during minimal PWM duty cycles, to keep the high-side power stage FET (LDMOS) fully turned on during the remaining part of the PWM cycle. In an application running at a reduced switching frequency, generally 192 kHz, the bootstrap capacitor might need to be increased in value.

Special attention should be paid to the power-stage power supply; this includes component selection, PCB placement, and routing. As indicated, each half-bridge has independent power-stage supply pins (PVDD_X). For optimal electrical performance, EMI compliance, and system reliability, it is important that each PVDD_X pin is decoupled with a 100-nF ceramic capacitor placed as close as possible to each supply pin.

Product Folder Link(s): *TAS5701*

The 12-V supply should be from a low-noise, low-output-impedance voltage regulator. Likewise, the 18-V power-stage supply is assumed to have low output impedance and low noise. The power-supply sequence is not critical as facilitated by the internal power-on-reset circuit. Moreover, the TAS5701 is fully protected against erroneous power-stage turnon due to parasitic gate charging.

Clock, Auto Detection, and PLL

The TAS5701 digital audio processor (DAP) is a clock slave device. It accepts MCLK, SCLK, and LRCLK.

The TAS5701 checks to verify that SCLK is a specific value of 32-f_s, 48-f_s, or 64-f_s. The DAP only supports a 1 × f_s LRCLK. The timing relationship of these clocks to SDIN1 and SIN2 is shown in subsequent sections. The clock section uses MCLK or the internal oscillator clock (when MCLK is unstable or absent) to produce the internal clock.

The DAP can auto-detect and set the internal clock control logic to the appropriate settings for the frequencies of 32 kHz, normal speed (44.1 or 48 kHz), double speed (88.2 kHz or 96 kHz), and quad speed (176.4 kHz or 192 kHz).

SERIAL DATA INTERFACE

Serial data is input on SDIN1 and SIN2. The PWM outputs are derived from SDIN1 ands SIN2. The TAS5701 DAP accepts 32-, 44.1-, 48-, 88.2-, 96-, 176.4-, and 192-kHz serial data in 16-, 18-, 20-, or 24-bit data in left-justified, right-justified, and I²S serial data formats. See Table 1 for format control settings.

SDIN1 left channel data is sent to OUTA/OUTB configured in BTL. SDIN1 right channel data is sent to OUTC/OUTD. SDIN2 left channel data is sent to SUB_PWM+/–. The right channel data of SDIN2 is ignored.

PWM SECTION

The DAP (digital audio processor) has three channels of high-performance digital PWM modulators that are designed to drive bride-tied output H-bridge configurations with BD modulation.

The DAP uses noise-shaping and sophisticated error correction algorithms to achieve high power efficiency and high-performance digital audio reproduction. The DAP uses a fourth-order noise shaper to provide >100-dB SNR performance from 20 Hz to 20 kHz.

The PWM section accepts 24-bit PCM data from the DAP and outputs three PWM audio output channels. The PWM section output supports bridge-tied loads ONLY.

The PWM section has individual channel dc blocking filters that are ALWAYS enabled. The filter cutoff frequency is less than 1 Hz.

Finally, the PWM section has a fixed maximum modulation limit of 97.7%.

SERIAL INTERFACE CONTROL AND TIMING

I²S Timing

I²S timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is low for the left channel and high for the right channel. A system clock (SCLK) running at 32, 48, or 64 × f_s is used to clock in the data. There is a delay of one bit clock from the time the LRCLK signal changes state to the first bit of data on the data lines. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused trailing data bit positions.
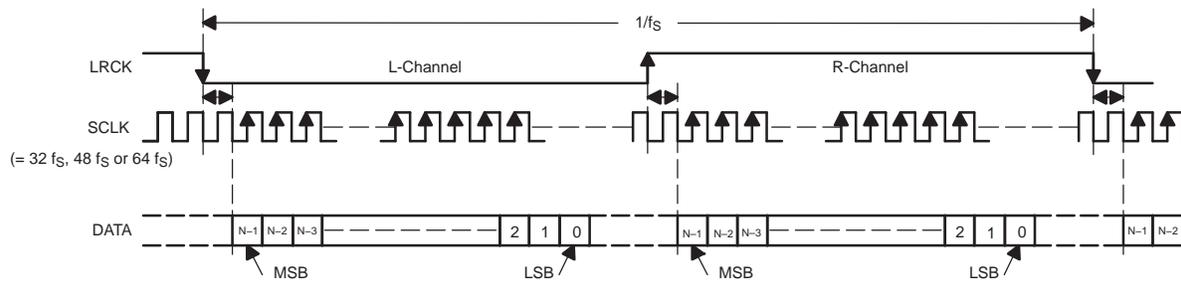

Figure 18. I²S Format

Left-Justified

Left-justified (LJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_s is used to clock in the data. The first bit of data appears on the data lines at the same time LRCLK toggles. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused trailing data bit positions.
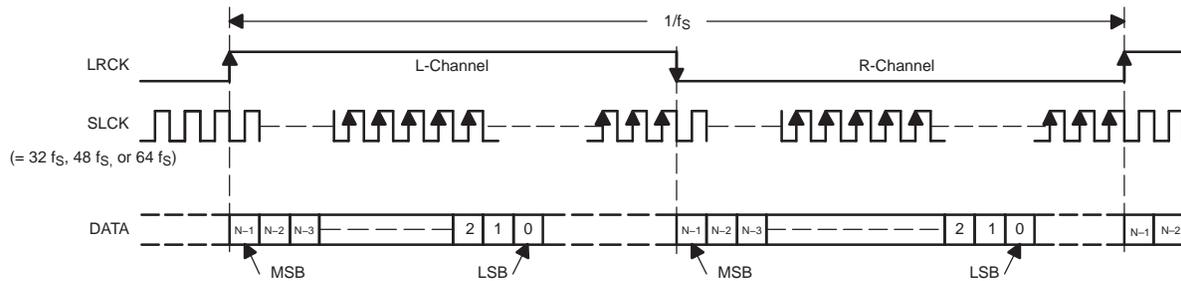

Figure 19. Left-Justified Format

Right-Justified

Right-justified (RJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_s is used to clock in the data. The first bit of data appears on the data 8 bit-clock periods (for 24-bit data) after LRCLK toggles. In RJ mode the LSB of data is always clocked by the last bit clock before LRCLK transitions. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused leading data bit positions.

Product Folder Link(s): *TAS5701*
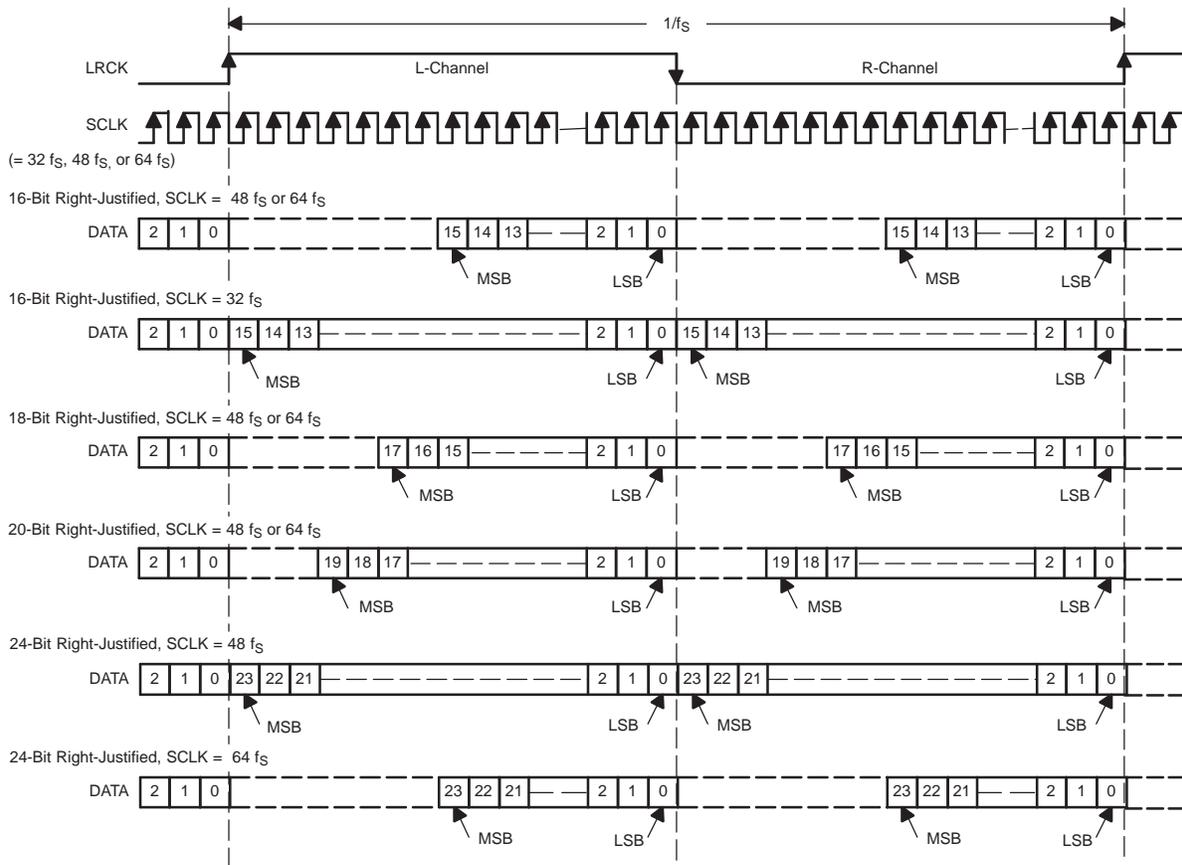

Figure 20. Right-Justified Format

Format Control

The digital data input format is selected via three external terminals (FORMAT0, FORMAT1, and FORMAT2). Table 1 lists the corresponding data format for SDIN1 and SDIN2. LRCLK and SCLK are shared clocks for SDIN1 and SDIN2. Changes to the FORMATx terminals are latched in immediately on a rising edge of $\overline{RESET}$. Changes to the FORMATx terminals while $\overline{RESET}$ is high are not allowed.

Table 1. Format Control

FORMAT2	FORMAT1	FORMAT0	SERIAL DIGITAL DATA FORMAT
0	0	0	16-Bit right-justifed
0	0	1	18-Bit right-justified
0	1	0	20-Bit right-justified
0	1	1	24-Bit right-justified
1	0	0	16-, 24-Bit I^{2}S
1	0	1	16-, 24-Bit left-justified
1	1	0	Reserved. Setting is not allowed.
1	1	1	Reserved. Setting is not allowed.

Gain Control

The gain of the DAP is selected via two external gain pins (GAIN_0 and GAIN_1). Table 2 lists the corresponding channel gain (for ALL channels) for GAIN_0 and GAIN_1 settings. Individual channel gain is not possible. Changes to the GAIN_x terminals are latched in immediately on a rising edge of $\overline{RESET}$. Changes to the GAIN_x terminals while $\overline{RESET}$ is high are not allowed.

Table 2. Gain Control

GAIN_1	GAIN_0	CHANNEL GAIN (dB)
0	0	0
0	1	6
1	0	12
1	1	18

DEVICE PROTECTION SYSTEM

The TAS5701 contains advanced protection circuitry carefully designed to facilitate system integration and ease of use, as well as to safeguard the device from permanent failure due to a wide range of fault conditions such as short circuits, overtemperature, and undervoltage. The TAS5701 responds to a fault by immediately setting the power stage in a high-impedance (Hi-Z) state and reporting the error on the $\overline{\text{FAULT}}$ pin ($\overline{\text{FAULT}}$ = 0); the device automatically recovers when the fault condition has been removed.

Short-Circuit Protection

The device has independent, fast-reacting current detectors on all high-side and low-side power-stage FETs. The detector outputs are closely monitored by a protection system. If a high-current condition situation exists, i.e., the power stage outputs are shorted, the protection system triggers a latching shutdown, resulting in the power stage being set in the high-impedance (Hi-Z) state and $\overline{\text{FAULT}}$ going low. Overcurrent protection is not independent for half-bridges A and B and, respectively, C and D. That is, if the bridge-tied load between half-bridges A and B causes an overcurrent fault, half-bridges A, B, C, and D are shut down.

Overtemperature Protection

If the device junction temperature exceeds 150°C (nominal), the device is put into thermal shutdown, resulting in all half-bridge outputs being set in the high-impedance (Hi-Z) state and $\overline{\text{FAULT}}$ going low. Once the temperature decreases 30°C (typical), the device resumes normal operation.

Undervoltage Protection (UVP) and Power-On Reset (POR)

The UVP and POR circuits of the TAS5701 fully protect the device in any power-up/down and brownout situation. While powering up, the POR circuit resets the protection circuitry and ensures that all circuits are fully operational when the VDD and GVDD_X supply voltages reach 9.6 V (typical). Although GVDD_x and VDD pins are independently monitored, a supply voltage drop below the UVP threshold on any VDD or GVDD_x pin results in all outputs immediately being set in the high-impedence (Hi-Z) state and $\overline{\text{FAULT}}$ pin being asserted low. The device automatically resumes operation when all supply voltages have increased above the UVP threshold.

REVISION HISTORY

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PAP (S–PQFP–G64)   PowerPAD™ PLASTIC QUAD FLATPACK

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
