

# TPS549D22 1.5-V to 16-V $V_{IN}$ , 4.5-V to 22-V $V_{DD}$ , 40-A SWIFT™ Synchronous Step-Down Converter with Full Differential Sense and PMBus™

## 1 Features

- Input Voltage Range ( $PV_{IN}$ ): 1.5 V to 16 V
- Input Bias Voltage ( $V_{DD}$ ) Range: 4.5 V to 22 V
- Output Voltage Range: 0.6 V to 5.5 V
- Integrated, 2.9-m $\Omega$  and 1.2-m $\Omega$  Power MOSFETs with 40-A Continuous Output Current
- Voltage Reference 0.6 V to 1.2 V in 50 mV Steps Using VSEL Pin
- $\pm 0.5\%$ , 0.9- $V_{REF}$  Tolerance Range:  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  Junction Temperature
- True Differential Remote Sense Amplifier
- D-CAP3™ Control Loop
- Adaptive On-Time Control with 8 PMBus™ Frequency Settings: 315 kHz, 425 kHz, 550 kHz, 650 kHz, 825 kHz, 900 kHz, 1.025 MHz, 1.125 MHz
- Temperature Compensated and Programmable Current Limit with  $R_{ILIM}$  and OC Clamp
- Choice of Hiccup or Latch-Off OVP or UVP
- VDD UVLO External Adjustment by Precision EN
- Prebias Startup Support
- Eco-mode™ and FCCM Selectable
- Full Suite of Fault Protection and PGOOD
- Standard VOUT\_COMMAND and VOUT\_MARGIN (HIGH and LOW)
- Pin-Strapping and On-the-Fly Programming
- Fault Reporting and Warning
- NVM Backup for Selected Commands
- 1-MHz PMBus with PEC and SMB\_ALERT#
- 5 mm  $\times$  7 mm  $\times$  1.5 mm, 40-Pin, Stack Clipped LQFN-CLIP Package

## 2 Applications

- Enterprise Storage, SSD, NAS
- Wireless and Wired Communication Infrastructure
- Industrial PCs, Automation, ATE, PLC, Video Surveillance
- Enterprise Server, Switches, Routers
- ASIC, SoC, FPGA, DSP Core and I/O Rails

## 3 Description

The TPS549D22 device is a compact single buck converter with adaptive on-time, D-CAP3 mode control. It is designed for high accuracy, high efficiency, fast transient response, ease-of-use, low external component count and space-conscious power systems.

This device features full differential sense, TI integrated FETs with a high-side on-resistance of 2.9 m $\Omega$  and a low-side on-resistance of 1.2 m $\Omega$ . The device also features accurate 0.5%, 0.9-V reference with an ambient temperature range between  $-40^{\circ}\text{C}$  and  $125^{\circ}\text{C}$ . Competitive features include: very low external component count, accurate load regulation and line regulation, auto-skip or FCCM mode operation, and internal soft-start control.

The TPS549D22 device is available in 5 mm  $\times$  7 mm, 40-pin, LQFN-CLIP (RVF) package (RoHs exempt).

### Device Information<sup>(1)</sup>

| PART NUMBER | PACKAGE  | BODY SIZE (NOM)          |
|-------------|----------|--------------------------|
| TPS549D22   | QFN (40) | 5.00 mm $\times$ 7.00 mm |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

|                                             |                                  | < 10 ns | −5.0 | 27.0 |
| Output voltage range                        | PGOOD, BP                        | −0.3    | 7.7  | V    |
| Output voltage range                        | SMB_ALRT#, PMB_DATA              | −0.3    | 6.0  | V    |
| Junction temperature range, T <sub>J</sub>  |                                  | −55     | 150  | °C   |
| Storage temperature range, T <sub>stg</sub> |                                  | −55     | 150  | °C   |

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to the network ground terminal unless otherwise noted.

### 6.2 ESD Ratings

|                    |                         |                                                                                | VALUE | UNIT |
|--------------------|-------------------------|--------------------------------------------------------------------------------|-------|------|
| V <sub>(ESD)</sub> | Electrostatic discharge | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>              | ±2000 | V    |
|                    |                         | Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup> | ±500  |      |

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|                                            |                                  |         | MIN  | MAX  | UNIT |
|--------------------------------------------|----------------------------------|---------|------|------|------|

## 7 Detailed Description

### 7.1 Overview

TPS549D22 device is a high-efficiency, single channel, FET-integrated, synchronous buck converter. It is suitable for point-of-load applications with 40 A or lower output current in storage, telecom and similar digital applications. The device features proprietary D-CAP3 mode control combined with adaptive on-time architecture. This combination is ideal for building modern high/low duty ratio, ultra-fast load step response DC-DC converters.

TPS549D22 device has integrated MOSFETs rated at 40-A TDC.

The converter input voltage range is from 1.5 V up to 16 V, and the VDD input voltage range is from 4.5 V to 22 V. The output voltage ranges from 0.6 V to 5.5 V.

Stable operation with all ceramic output capacitors is supported, since the D-CAP3 mode uses emulated current information to control the modulation. An advantage of this control scheme is that it does not require phase compensation network outside which makes it easy to use and also enables low external component count. . Adaptive on-time control tracks the preset switching frequency over a wide range of input and output voltage while increasing switching frequency as needed during load step transient.

The default preset switching frequency for this device is 650 kHz. Switching frequency is also programmable from 8 preset values via PMBus interface. The TPS549D22 supports digital communication via PMBus using standard interfacing pins, PMB\_CLK, PMB\_DATA and SMB\_ALRT#. The detailed PMBus features, capabilities and command sets of the TPS549D22 can be found in section [PMBus Programming](#).

## 7.3 Feature Description

### 7.3.1 40-A FET

The TPS549D22 device is a high-performance, integrated FET converter supporting current rating up to 40 A thermally. It integrates two N-channel NexFET™ power MOSFETs, enabling high power density and small PCB layout area. The drain-to-source breakdown voltage for these FETs is 25 V DC and 27 V transient for 10 ns. Avalanche breakdown occurs if the absolute maximum voltage rating exceeds 27 V. In order to limit the switch node ringing of the device, it is recommended to add a R-C snubber from the SW node to the PGND pins. Refer to the [Layout Guidelines](#) section for the detailed recommendations.

## Feature Description (continued)

### 7.3.2 On-Resistance

The typical on-resistance ( $R_{DS(on)}$ ) for the high-side MOSFET is 2.9 m $\Omega$  and typical on-resistance for the low-side MOSFET is 1.2 m $\Omega$  with a nominal gate voltage ( $V_{GS}$ ) of 5 V.

### 7.3.3 Package Size, Efficiency and Thermal Performance

The TPS549D22 device is available in a 5 mm x 7 mm, QFN package with 40 power and I/O pins. It employs TI proprietary MCM packaging technology with thermal pad. With a properly designed system layout, applications achieve optimized safe operating area (SOA) performance. The curves shown in and Figure 23 are based on the orderable evaluation module design. (See to order the EVM)

$V_{IN} = 12\text{ V}$        $V_{OUT} = 1\text{ V}$        $f_{SW} = 650\text{ kHz}$

**Figure 23. Safe Operating Area**

$V_{IN} = 12\text{ V}$        $V_{OUT} = 5\text{ V}$        $f_{SW} = 425\text{ kHz}$

**Figure 24. Safe Operating Area**

### 7.3.4 Soft-Start Operation

In the TPS549D22 device the soft-start time controls the inrush current required to charge the output capacitor bank during startup. The device offers selectable soft-start options of 1 ms, 2 ms, 4 ms and 8 ms. When the device is enabled (either by EN or VDD UVLO), the reference voltage ramps from 0 V to the final level defined by VSEL pin strap configuration, in a given soft-start time. The TPS549D22 device supports several soft-start times between 1msec and 8msec selected by MODE pin configuration. Refer to MODE definition table for details.

### 7.3.5 VDD Supply Undervoltage Lockout (UVLO) Protection

The TPS549D22 device provides fixed VDD undervoltage lockout threshold and hysteresis. The typical VDD turn-on threshold is 4.25 V and hysteresis is 0.2 V. The VDD UVLO can be used in conjunction with the EN\_UVLO signal to provide proper power sequence to the converter design. UVLO is a non-latched protection.

### 7.3.6 EN\_UVLO Pin Functionality

The EN\_UVLO pin drives an input buffer with accurate threshold and can be used to program the exact required turn-on and turn-off thresholds for switcher enable, VDD UVLO or VIN UVLO (if VIN and VDD are tied together). If desired, an external resistor divider can be used to set and program the turn-on threshold for VDD or VIN UVLO.

Figure 25 shows how to program the input voltage UVLO using the EN\_UVLO pin.

## Feature Description (continued)

**Figure 25. Programming the UVLO Voltage**

### 7.3.7 Fault Protections

This section describes positive and negative overcurrent limits, overvoltage protections, out-of-bounds limits, undervoltage protections and over temperature protections.

#### 7.3.7.1 Current Limit (ILIM) Functionality

**Figure 26. Current Limit Resistance vs. OCP Valley Overcurrent Limit**

The ILIM pin sets the OCP level. Connect the ILIM pin to GND through the voltage setting resistor,  $R_{ILIM}$ . In order to provide both good accuracy and cost effective solution, TPS549D22 device supports temperature compensated internal MOSFET  $R_{DS(on)}$  sensing.

## Feature Description (continued)

Also, the TPS549D22 device performs both positive and negative inductor current limiting with the same magnitudes. The positive current limit normally protects the inductor from saturation that causes damage to the high-side FET and low-side FET. The negative current limit protects the low-side FET during OVP discharge.

The voltage between GND pin and SW pin during the OFF time monitors the inductor current. The current limit has 3000 ppm/°C temperature slope to compensate the temperature dependency of the on-resistance ( $R_{DS(on)}$ ). The GND pin is used as the positive current sensing node.

TPS549D22 device uses cycle-by-cycle over-current limiting control. The inductor current is monitored during the OFF state and the controller maintains the OFF state during the period that the inductor current is larger than the overcurrent ILIM level.  $V_{ILIM}$  sets the valley level of the inductor current.

### 7.3.7.2 VDD Undervoltage Lockout (UVLO)

The TPS549D22 device has an UVLO protection function for the VDD supply input. The on-threshold voltage is 4.25 V with 200 mV of hysteresis. During a UVLO condition, the device is disabled regardless of the EN\_UVLO pin voltage. The supply voltage ( $V_{VDD}$ ) must be above the on-threshold to begin the pin strap detection.

### 7.3.7.3 Overvoltage Protection (OVP) and Undervoltage Protection (UVP)

The device monitors a feedback voltage to detect overvoltage and undervoltage. When the feedback voltage becomes lower than 68% of the target voltage, the UVP comparator output goes high and an internal UVP delay counter begins counting. After 1 ms, the device latches OFF both high-side and low-side MOSFETs drivers. The UVP function enables after soft-start is complete.

When the feedback voltage becomes higher than 120% of the target voltage, the OVP comparator output goes high and the circuit latches OFF the high-side MOSFET driver and turns on the low-side MOSFET until reaching a negative current limit. Upon reaching the negative current limit, the low-side FET is turned off and the high-side FET is turned on again for a minimum on-time. The TPS549D22 device operates in this cycle until the output voltage is pulled down under the UVP threshold voltage for 1 ms. After the 1-ms UVP delay time, the high-side FET is latched off and low-side FET is latched on. The fault is cleared with a reset of VDD or by retoggling the EN pin.

**Table 1. Overvoltage Protection Details**

| REFERENCE VOLTAGE ( $V_{REF}$ ) | SOFT-START RAMP | STARTUP OVP THRESHOLD                 | OPERATING OVP THRESHOLD               | OVP DELAY 100 mV OD ( $\mu$ s) | OVP RESET |
|---------------------------------|-----------------|---------------------------------------|---------------------------------------|--------------------------------|-----------|
| Internal                        | Internal        | $1.2 \times \text{Internal } V_{REF}$ | $1.2 \times \text{Internal } V_{REF}$ | 1                              | UVP       |

### 7.3.7.4 Out-of-Bounds Operation

The device has an out-of-bounds (OOB) overvoltage protection that protects the output load at a much lower overvoltage threshold of 8% above the target voltage. OOB protection does not trigger an overvoltage fault, so the device is not latched off after an OOB event. OOB protection operates as an early no-fault overvoltage-protection mechanism. During the OOB operation, the controller operates in forced PWM mode only by turning on the low-side FET. Turning on the low-side FET beyond the zero inductor current quickly discharges the output capacitor thus causing the output voltage to fall quickly toward the setpoint. During the operation, the cycle-by-cycle negative current limit is also activated to ensure the safe operation of the internal FETs.

### 7.3.7.5 Over-Temperature Protection

TPS549D22 device has over-temperature protection (OTP) by monitoring the die temperature. If the temperature exceeds the threshold value (default value 165°C), TPS549D22 device is shut off. When the temperature falls about 25°C below the threshold value, the device turns on again. The OTP is a non-latch protection.

## 7.4 Device Functional Modes

### 7.4.1 DCAP3 Control Topology

The TPS549D22 employs an artificial ramp generator that stabilizes the loop. The ramp amplitude is automatically adjusted as a function of selected switching frequency ( $f_{sw}$ ). The ramp amplitude is a function of duty cycle ( $V_{OUT}$ -to- $V_{IN}$  ratio). Consequently, two additional pin-strap bits (ADDR[2:1]) are provided for fine tuning the internal ramp amplitude. The device uses an improved DCAP3 control loop architecture that incorporates a steady-state error integrator. The slow integrator improves the output voltage DC accuracy greatly and presents minimal impact to small signal transient response. To further enhance the small signal stability of the control loop, the device uses a modified ramp generator that supports a wider range of output LC stage.

### 7.4.2 DCAP Control Topology

For advanced users of this device, the internal DCAP3 ramp can be disabled using the MODE[4] pin strap bit. This situation requires an external RCC network to ensure control loop stability. Place this RCC network across the output inductor. Use a range between 10 mV and 15 mV of injected RSP pin ripple. If no feedback resistor divider network is used, insert a 10-k $\Omega$  resistor between the VOUT pin and the RSP pin.

## 7.5 Programming

### 7.5.1 Programmable Pin-Strap Settings

ADDR, VSEL and MODE. Description: a 1% or better 100-k $\Omega$  resistor is needed from BP to each of the three pins. The bottom resistor from each pin to ground (see **MODE**, **VSEL**, **ADDR DETECTION** section of the [Electrical Characteristics](#) table) in conjunction with the top resistor defines each pin strap selection. The pin detection checks for external resistor divider ratio during initial power up (VDD is brought down below approximately 3 V) when BP LDO output is at approximately 2.9 V.

#### 7.5.1.1 Address Selection (ADDR) Pin

The TPS549D22 allows up to 16 different chip addresses for PMBus communication with the first 3 bits fixed as 001. The address selection process is defined by resistor divider ratio from BP pin to ADDR pin, and the address detection circuit will start to work only after the initial power up when VDD has risen above its UVLO threshold. lists all combinations of the address selections. The 1% or better tolerance resistors with typical temperature coefficient of  $\pm 100$  ppm/ $^{\circ}$ C are recommended.

ADDR pin strap configuration also programs the light load conduction mode.

## Programming (continued)

### 7.5.1.2 VSEL Pin

VSEL pin strap configuration is used to program initial boot voltage value, hiccup mode and latch off mode. The initial boot voltage is used to program the main loop voltage reference point. VSEL voltage settings provide TI designated discrete internal reference voltages. [Table 2](#) lists internal reference voltage selections.

**Table 2. Internal Reference Voltage Selections**

| VSEL[4]        | VSEL[3] | VSEL[2] | VSEL[1] | VSEL[0]      | R <sub>VSEL</sub> (kΩ) <sup>(1)</sup> |

### 7.5.1.3 DCAP3 Control and Mode Selection

The MODE pinstrap configuration programs the control topology and internal soft-start timing selections. The TPS549D22 device supports both DCAP3 and DCAP operation

MODE[4] selection bit is used to set the control topology. If MODE[4] bit is “0”, it selects DCAP operation. If MODE[4] bit is “1”, it selects DCAP3 operation.

MODE[1] and MODE[0] selection bits are used to set the internal soft-start timing

**Table 3. Allowable MODE Pin Selections**

| MODE[4]  | MODE[3]               | MODE[2]        | MODE[1]  | MODE[0] | R <sub>MODE</sub> (kΩ) <sup>(1)</sup> |  |
|----------|-----------------------|----------------|----------|---------|---------------------------------------|--|

## 7.5.2 Programmable Analog Configurations

### 7.5.2.1 RSP/RSN Remote Sensing Functionality

RSP and RSN pins are used for remote sensing purpose. In the case where feedback resistors are required for output voltage programming, the RSP pin should be connected to the mid-point of the resistor divider and the RSN pin should always be connected to the load return. In the case where feedback resistors are not required as when the VSEL programs the output voltage set point, the RSP pin should be connected to the positive sensing point of the load and the RSN pin should always be connected to the load return.

RSP and RSN pins are extremely high-impedance input terminals of the true differential remote sense amplifier. The feedback resistor divider should use resistor values much less than 100 k $\Omega$ .

#### 7.5.2.1.1 Output Differential Remote Sensing Amplifier

The examples in this section show simplified remote sensing circuitry where each example uses an internal reference of 1.0 V. [Figure 27](#) shows remote sensing without feedback resistors, with an output voltage set point of 1 V. [Figure 28](#) shows remote sensing using feedback resistors, with an output voltage set point of 5 V.

**Figure 27. Remote Sensing Without Feedback Resistors**

**Figure 28. Remote Sensing With Feedback Resistors**

### 7.5.2.2 Power Good (PGOOD Pin) Functionality

The TPS549D22 device has power-good output that registers high when switcher output is within the target. The power-good function is activated after soft-start has finished. When the soft-start ramp reaches 300 mV above the internal reference voltage, SSend signal goes high to enable the PGOOD detection function. If the output voltage becomes within  $\pm 8\%$  of the target value, internal comparators detect power-good state and the power good signal becomes high after a 1 ms delay. If the output voltage goes outside of  $\pm 16\%$  of the target value, the power good signal becomes low after two microsecond (2- $\mu$ s) internal delay. The open-drain power-good output must be pulled up externally. The internal N-channel MOSFET does not pull down until the VDD supply is above 1.2 V.

### 7.5.3 PMBus Programming

TPS549D22 has seven internal custom user-accessible 8-bit registers. The PMBus interface has been designed for program flexibility, supporting direct format for write operation. Read operations are supported for both combined format and stop separated format. While there is no auto increment/decrement capability in the TPS549D22 PMBus logic, a tight software loop can be designed to randomly access the next register independent of which register was accessed first. The start and stop commands frame the data packet and the repeat start condition is allowed when necessary.

#### 7.5.3.1 TPS549D22 Limitations to the PMBUS Specifications

TPS549D22 only recognizes seven bit addressing. This means TPS549D22 is not compatible with ten bit addressing and CBUS communication. The device can operate in standard mode (100 kbit/s), fast mode (400 kbit/s) or faster mode (1000 kbit/s).

#### 7.5.3.2 Slave Address Assignment

The seven bit slave address is  $001A_3A_2A_1A_0x$ , where  $A_3A_2A_1A_0$  is set by the ADDR pin on the device. Bit 0 is the data direction bit, i.e.  $001A_3A_2A_1A_00$  is used for write operation and  $001A_3A_2A_1A_01$  is used for read operation.

#### 7.5.3.3 PMBUS Address Selection

TPS549D22 allows up to 16 different chip addresses for PMBus communication, with the first three bits fixed as 001. The address selection process is defined by the resistor divider ratio from BP pin to ADDR pin, and the address detection circuit will start to work only after VDD input supply has risen above its UVLO threshold. [Table 4](#) lists the divider ratio and some example resistor values. The 1% tolerance resistors with typical temperature coefficient of  $\pm 100$  ppm/°C are recommended. Higher performance resistors can be used if tighter noise margin is required for more reliable address detection.

#### 7.5.3.4 Supported Formats

The supported formats are described in the following subsections.

##### 7.5.3.4.1 Direct Format — Write

The simplest format for a PMBus write is direct format. After the start condition [S], the slave chip address is sent, followed by an eighth bit indicating a write. TPS549D22 then acknowledges that it is being addressed, and the master responds with an 8 bit register address byte. The slave acknowledges and the master sends the appropriate 8 bit data byte. Once again the slave acknowledges and the master terminates the transfer with the stop condition [P].

##### 7.5.3.4.2 Combined Format — Read

After the start condition [S], the slave chip address is sent, followed by an eighth bit indicating a write. TPS549D22 then acknowledges that it is being addressed, and the master responds with an 8 bit register address byte. The slave acknowledges and the master sends the repeated start condition [Sr]. Once again, the slave chip address is sent, followed by an eighth bit indicating a read. The slave responds with an acknowledge followed by previously addressed 8 bit data byte. The master then sends a non-acknowledge (NACK) and finally terminates the transfer with the stop condition [P].

##### 7.5.3.5 Stop Separated Reads

Stop-separated reads can also be used. This format allows a master to set up the register address pointer for a read and return to that slave at a later time to read the data. In this format the slave chip address followed by a write bit are sent after a start [S] condition. TPS549D22 then acknowledges it is being addressed, and the master responds with the 8-bit register address byte. The master then sends a stop or restart condition and may then address another slave. After performing other tasks, the master can send a start or restart condition to the TPS549D22 with a read command. The device acknowledges this request and returns the data from the register location that had been set up previously.

**Table 4. ADDR Pin Selection Table**

| PMBus_Address<3:0> |   |   |   | CM      | RADDR (kΩ)<br>(1% or better and<br>connect to ground) |

### 7.5.3.6 Supported PMBUS Commands and Registers

Only the following PMBus commands are supported by TPS549D22, and not all parts of each command are supported.

**Table 5. PMBUS Command and Register Table**

| CMD CODE | COMMAND NAME        | DESCRIPTION                                                                                                                                                                                                   | NVM? | TYPE      | No. of DATA BYTES | BIT PATTERN                                                                                                                                                                                                                                                                                 |
|----------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1h       | OPERATION           | The OPERATION command is used to turn the unit on and off in conjunction with the input from the EN pin. It is also used to cause the device to set the output voltage to the upper or lower Margin voltages. | no   | R/W Byte  | 1                 | 00XX XX00 = Turn Off<br>1000 XX00 = Turn on (VOUT Margin off)<br>1001 0100 = Turn on (VOUT Margin Low, Ignore Fault)<br>1001 1000 = Turn on (VOUT Margin Low, Act on Fault)<br>1010 0100 = Turn on (VOUT Margin High, Ignore Fault)<br>1010 1000 = Turn on (VOUT Margin High, Act on Fault) |
| 2h       | ON_OFF_CONFIG       | Configures the combination of EN pin input and serial bus commands needed to turn the unit on and off. This includes how the unit responds when power is applied.                                             | yes  | R/W Byte  | 1                 | 0001 0011 = Act on neither OPERATION nor EN pin<br>0001 0111 = Act on EN pin and ignore OPERATION<br>0001 1011 = Act on OPERATION and ignore EN pin<br>0001 1111 = Act on OPERATION and Act on EN pin (requires both)                                                                       |
| 3h       | CLEAR_FAULTS        | Clears all fault status registers to 0x00 and deasserts SMBAlert. The "Unit is Off" bit in the status byte and "PGOOD# de-assertion" bit in the status word are not cleared when this command is issued.      | no   | Send Byte | 0                 | No data. Write only.                                                                                                                                                                                                                                                                        |
| 10h      | WRITE_PROTECT       | Prevents unwanted writes to the device. This register can be over-written. This is not a permanent lock.                                                                                                      | yes  | R/W Byte  | 1                 | 1000 0000 Only allow WRITE_PROTECT<br>0100 0000 Only allow WRITE_PROTECT and OPERATION<br>0010 0000 Only allow WRITE_PROTECT, OPERATION, ON_OFF_CONFIG and VOUT_COMMAND<br>0000 0000 Allow all writes                                                                                       |
| 11h      | STORE_DEFAULT_ALL   | Copies Operating Memory to matching non-volatile Default Store Memory.                                                                                                                                        | no   | Send Byte | 0                 | No data. Write only.                                                                                                                                                                                                                                                                        |
| 12h      | RESTORE_DEFAULT_ALL | Restores all parameters from non-volatile Default Store Memory to Operating Memory                                                                                                                            | no   | Send Byte | 0                 | No data. Write only.                                                                                                                                                                                                                                                                        |
| 19h      | CAPABILITY          | This command provides a way for a host system to determine some key capabilities of a PMBus device, including PEC, Alert and Speed.                                                                           | no   | Read Byte | 1                 | 1101 0000 = PEC, 1MHz bus speed, ALERT                                                                                                                                                                                                                                                      |
| 20h      | VOUT_MODE           | Hard coded to linear mode with exponent of -9.                                                                                                                                                                | no   | Read Byte | 1                 | 000x xxxx = Linear format.<br>0001 0111 = Exponent value of -9 (1.953mV resolution)                                                                                                                                                                                                         |
| 21h      | VOUT_COMMAND        | Output voltage setpoint. DAC resolution is 1.9531mV and range is -0.6V to ~1.200V                                                                                                                             | yes  | R/W Word  | 2                 | 0000 0001 0011 0011 = 0.5996V<br>0000 0010 0110 0110 = 1.1992V                                                                                                                                                                                                                              |
| 25h      | VOUT_MARGIN_HIGH    | Sets the voltage to which the output is to be changed when the OPERATION command is set to "MARGIN HIGH".                                                                                                     | no   | R/W Word  | 2                 | 0000 0001 0011 0011 = 0.5996V<br>0000 0010 0110 0110 = 1.1992V                                                                                                                                                                                                                              |
| 26h      | VOUT_MARGIN_LOW     | Sets the voltage to which the output is to be changed when the OPERATION command is set to "MARGIN LOW".                                                                                                      | no   | R/W Word  | 2                 | 0000 0001 0011 0011 = 0.5996V<br>0000 0010 0110 0110 = 1.1992V                                                                                                                                                                                                                              |
| 78h      | STATUS_BYTE         | Status of all fault conditions in a data byte.                                                                                                                                                                | no   | Read Byte | 1                 | See Status Word Table                                                                                                                                                                                                                                                                       |
| 79h      | STATUS_WORD         | Status of all fault conditions in two data bytes.                                                                                                                                                             | no   | Read Word | 2                 | See Status Word Table                                                                                                                                                                                                                                                                       |
| 7Ah      | STATUS_VOUT         | Returns one byte of information relating to the status of the output voltage related faults.                                                                                                                  | no   | Read Byte | 1                 | See Status Vout Table                                                                                                                                                                                                                                                                       |
| 7Bh      | STATUS_OUT          | Returns one byte of information relating to the status of the output current related faults.                                                                                                                  | no   | Read Byte | 1                 | See Status Iout Table                                                                                                                                                                                                                                                                       |

| 1   |       | R/W  | 1     |                                              |
| 0   |       | R/W  | 1     |                                              |

### 7.5.4.3 CLEAR FAULTS (address = 3h)

The CLEAR\_FAULTS command is used to clear any fault bits that have been set. This command simultaneously clears all bits in all status registers. At the same time, the device clears its SMB\_ALERT# signal output if the device is asserting the SMB\_ALERT# signal.

The CLEAR\_FAULTS command does not cause a unit that has latched off for a fault condition to restart. If the fault is still present when the bit is cleared, the fault bit shall immediately be set again and the host notified by the usual means.

#### 7.5.4.4 WRITE PROTECT (address = 10h)

**Figure 32. WRITE PROTECT**

| 7   | 6   | 5   | 4 | 3 | 2 | 1 | 0 |
|-----|-----|-----|---|---|---|---|---|
| 0   | 0   | 0   | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R | R |

LEGEND: R/W = Read/Write; R = Read only; -n = value after reset

**Table 11. WRITE PROTECT**

| Bit | Field         | Type | Reset | Description                                                                                                                                                                                                                                                     |
|-----|---------------|------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7:0 | WRITE_PROTECT | R/W  | 0     | 00000000: Enable writes to ALL commands<br>00100000: Enable writes to only WRITE_PROTECT, OPERATION and ON_OFF_CONFIG and VOUT_COMMAND commands<br>01000000: Enable writes to only WRITE_PROTECT and OPERATION<br>10000000: Enable writes to only WRITE_PROTECT |

#### 7.5.4.5 STORE\_DEFAULT\_ALL (address = 11h)

Store all of the current storable register settings in the EEPROM memory as the new defaults on power up.

It is permitted to use the STORE\_DEFAULT\_ALL command while the device is operating. However, the device may be unresponsive during the write operation with unpredictable memory storage results. TI recommends to turn the device output off before issuing this command.

EEPROM programming faults will set the 'CML' bit in the STATUS\_BYTE and the 'MEM' bit in the STATUS\_CML registers.

#### 7.5.4.6 RESTORE\_DEFAULT\_ALL (address = 12h)

Write EEPROM data to those CSRs that: (1) have EEPROM support, and; (2) are unprotected according to current setting of WRITE\_PROTECT.

It is permitted to use the RESTORE\_DEFAULT\_ALL command while the device is operating. However, the device may be unresponsive during the copy operation with unpredictable, undesirable or even catastrophic results. TI recommends to turn the device output off before issuing this command.

No data bytes are sent, just the command code is sent.

#### 7.5.4.7 CAPABILITY (address = 19h)

This command provides a way for a host system to determine some key capabilities of this PMBus device.

**Figure 33. CAPABILITY**

| 7     | 6           | 5 | 4      | 3 | 2 | 1 | 0 |

**Table 13. VOUT\_MODE**

| Bit | Field      | Type | Reset | Description                                        |
|-----|------------|------|-------|----------------------------------------------------|
| 7:5 | MODE = 000 | R    | 0     | 000: Linear Format                                 |
| 4:0 | Exponent   | R    | 17h   | 10111: Exponent = -9 (equivalent of 1.9531 mV/LSB) |

#### 7.5.4.9 VOUT\_COMMAND (address = 21h)

The VOUT\_COMMAND command sets the output voltage in volts. The exponent is set by VOUT\_MODE at -9 (equivalent of 1.9531 mV/LSB). The programmed  $V_{OUT}$  is computed as:

$$V_{OUT} = VOUT\_COMMAND \times VOUT\_MODE \text{ volts} = VOUT\_COMMAND \times 2^{-9} \text{ V} \quad (1)$$

The support range for TPS549D22 is: 0.5996 V to 1.1992 V. It is effectively 9-bits limited to 307 to 614 decimal. Slew rate control is provided through MODE pin.

$V_{OUT}$  sets 1 step/ $t_{slew}$ , where  $t_{slew}$  is programmable by MODE pin: 4, 8, 16, or 32  $\mu$ s.

**Figure 35. VOUT\_COMMAND**

| 7 | 6 | 5 | 4 | 3 | 2 | 1   | 0   | 7        | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

| 7:0 | Mantissa | R/W  | xxxx xxxx |               |

#### 7.5.4.10 VOUT\_MARGIN\_HIGH (address = 25h) ®

The VOUT\_MARGIN\_HIGH command loads the TPS549D22 with the voltage to which the output is to be changed when the OPERATION command is set to "Margin High".

The data bytes are two bytes formatted according to the setting of the VOUT\_MODE command.

The support margin range for TPS549D22 is: 0.5996 V to 1.1992 V. It is effectively 9-bits limited to 307 to 614 decimal. Slew rate control is provided through MODE pin.

**Figure 36. VOUT\_MARGIN\_HIGH**

| 7 | 6 | 5 | 4 | 3 | 2 | 1   | 0   | 7        | 6   | 5   | 4   | 3   | 2   | 1   | 0   |

| 7:0 | Mantissa | R/W  | xxxx xxxx |               |

### 7.5.4.11 VOUT\_MARGIN\_LOW (address = 26h)

The VOUT\_MARGIN\_LOW command loads the TPS549D22 with the voltage to which the output is to be changed when the OPERATION command is set to “Margin Low”.

The data bytes are two bytes formatted according to the setting of the VOUT\_MODE command.

The support margin range for TPS549D22 is: 0.5996 V to 1.1992 V. It is effectively 9-bits limited to 307 to 614 decimal. Slew rate control is provided through MODE pin.

**Figure 37. VOUT\_MARGIN\_LOW:**

#### 7.5.4.20 MFR\_SPECIFIC\_02 (address = D2h)

The MFR\_SPECIFIC\_02 register allows the user to read the configuration of various pinstrap features and/or overwrite them. Note, that any overwritten values here are only good until the next power-on-reset; when all parameters will revert back to their pinstrap configurations.

**Figure 46. MFR\_SPECIFIC\_02**

| 7   | TRK         | R/W  | P     | This bit indicates whether the device is using internal or external reference voltage tracking. It will initially be loaded and reflect the value of the pinstrap; but, can also be overwritten by PMBus. 0: No tracking. The device will use internal reference voltage. 1: External tracking.                                                                             |
| 6   | SEQ         | R/W  | P     | This bit indicates whether the device is using internal or external soft-start ramp. It will initially be loaded and reflect the value of the pinstrap; but, can also be overwritten by PMBus. 0: No sequencing. The device will use the internal soft start ramp. 1: Sequencing                                                                                            |
| 5   |             | R    | 0     |                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | FORCESKIPSS | R/W  | 1     | This bit (when set) allows the user to force Soft-start to always use SKIP mode; regardless of the CM pinstrap. 0: CM bit controls whether to operate in SKIP or FCCM mode during and after soft start. 1: Soft start is forced to operate in SKIP mode, then CM bit controls the mode after soft start.                                                                    |
| 3:2 | SST         | R/W  | P     | These bits indicate the time the device takes to ramp the output voltage up to regulation (that is, soft-start). The field will initially be loaded and reflect the value of the pinstrap; but, can also be overwritten by PMBus. (Refer to <a href="#">Table 28</a> )                                                                                                      |
| 1   | HICLOFF     | R/W  | P     | This bit indicates the response the device will take upon an output under-voltage fault. There are two fault response options which are enforced by the analog circuits: Hiccup or Latch-off. The bit value will initially be loaded and reflect the value of the pinstrap; but, can also be overwritten by PMBus. 0: Hiccup after UVP fault. 1: Latch off after UVP fault. |
| 0   | CM          | R/W  | P     | This bit indicates the conduction mode for the device. The bit value will initially be loaded and reflect the value of the pinstrap; but, can also be overwritten by PMBus. 0: SKIP 1: FCCM                                                                                                                                                                                 |

**Table 28. SST**

| SST[1] | SST[0] | Soft-start time |
|--------|--------|-----------------|
| 0      | 0      | 1 ms            |
| 0      | 1      | 2 ms            |
| 1      | 0      | 4 ms            |
| 1      | 1      | 8 ms            |

### 7.5.4.21 MFR\_SPECIFIC\_03 (address = D3h)

The MFR\_SPECIFIC\_03 register allows the user to read the configuration of the DCAP pinstrap feature (and/or overwrite it); as well configure the Ramp Generator and the PWM switching frequency.

**Figure 47. MFR\_SPECIFIC\_03**

| 7     | 6 | 5    | 4 | 3 | 2   | 1 | 0 |

## 8 Applications and Implementation

---

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

---

### 8.1 Application Information

The TPS549D22 device is a highly-integrated synchronous step-down DC-DC converter with PMBus features and capabilities. This device is used to convert a higher DC input voltage to a lower DC output voltage, with a maximum output current of 40 A. Use the following design procedure to select key component values for this family of devices.

## 8.2 Typical Applications

### 8.2.1 TPS549D22 1.5-V to 16-V Input, 1-V Output, 40-A Converter

## 8.2.3 Design Procedure

### 8.2.3.1 Switching Frequency Selection

The default switching frequency of the TPS549D22 device is 650 kHz. There are a total of 8 switching frequency settings that can be programmed via PMBus interface. For each switching frequency setting, there are 4 internal ramp compensations (DCAP3) to choose from, also via PMBus. When DCAP3 mode is selected (preferred), the internal ramp compensation is used for stabilizing the converter design. The ramp is a function of the switching frequency and duty cycle range (the output voltage to input voltage ratio). [Table 40](#) summarizes the ramp choices using these functions.

**Table 40. Switching Frequency Selection**

| SWITCHING FREQUENCY<br>SETTING<br>(f <sub>SW</sub> ) (kHz) | RAMP<br>SELECT<br>OPTION | TIME<br>CONSTANT<br>t (μs) | V <sub>OUT</sub> RANGE<br>(FIXED V <sub>IN</sub> = 12 V) |     | DUTY CYCLE RANGE<br>(V <sub>OUT</sub> /V <sub>IN</sub> ) (%) |      |
|------------------------------------------------------------|--------------------------|----------------------------|----------------------------------------------------------|-----|--------------------------------------------------------------|------|

|                                                            | R × 3                    | 23.3                       | 2.5                                                      | 5.5 | >21                                                          |      |

### 8.2.3.2 Inductor Selection

To calculate the value of the output inductor, use [Equation 2](#). The coefficient K<sub>IND</sub> represents the amount of inductor ripple current relative to the maximum output current. The output capacitor filters the inductor ripple current. Therefore, choosing a high inductor ripple current impacts the selection of the output capacitor since the output capacitor must have a ripple current rating equal to or greater than the inductor ripple current. In general, maintain a K<sub>IND</sub> coefficient between 0 and 15 for balanced performance. Using this target ripple current, the required inductor size can be calculated as shown in [Equation 2](#)

$$L_1 = \frac{V_{OUT}}{(V_{IN(max)} \times f_{SW})} \times \frac{V_{IN} - V_{OUT}}{(I_{OUT(max)} \times K_{IND})} = \frac{1 \text{ V} \times (16 \text{ V} - 1 \text{ V})}{(16 \text{ V} \times 650 \text{ kHz} \times 40 \text{ A} \times 0.15)} = 0.24 \mu\text{H} \quad (2)$$

Selecting a K<sub>IND</sub> of 0.15, the target inductance L<sub>1</sub> = 250 nH. Using the next standard value, the 250 nH is chosen in this application for its high current rating, low DCR, and small size. The inductor ripple current, RMS current, and peak current can be calculated using [Equation 3](#), [Equation 4](#) and [Equation 5](#). These values should be used to select an inductor with approximately the target inductance value, and current ratings that allow normal operation with some margin.

$$I_{RIPPLE} = \frac{V_{OUT}}{(V_{IN(max)} \times f_{SW})} \times \frac{V_{IN(max)} - V_{OUT}}{L_1} = \frac{1 \text{ V} \times (16 \text{ V} - 1 \text{ V})}{16 \text{ V} \times 650 \text{ kHz} \times 250 \text{ nH}} = 5.64 \text{ A} \quad (3)$$

$$I_{L(rms)} = \sqrt{(I_{OUT})^2 + \frac{1}{12} \times (I_{RIPPLE})^2} = 40 \text{ A} \quad (4)$$

$$I_{L(peak)} = (I_{OUT}) + \frac{1}{2} \times (I_{RIPPLE}) = 43 \text{ A} \quad (5)$$

The Würth ferrite 744309025 inductor is rated for 50 A<sub>RMS</sub> current, and 48-A saturation. Using this inductor, the ripple current I<sub>RIPPLE</sub> = 5.64 A, the RMS inductor current I<sub>L(rms)</sub> = 40 A, and peak inductor current I<sub>L(peak)</sub> = 43 A.

### 8.2.3.3 Output Capacitor Selection

There are three primary considerations for selecting the value of the output capacitor. The output capacitor affects three criteria:

- Stability

- Regulator response to a change in load current or load transient
- Output voltage ripple

These three considerations are important when designing regulators that must operate where the electrical conditions are unpredictable. The output capacitance needs to be selected based on the most stringent of these three criteria.

#### 8.2.3.3.1 Minimum Output Capacitance to Ensure Stability

To prevent sub-harmonic multiple pulsing behavior, TPS549D22 application designs must strictly follow the small signal stability considerations described in [Equation 6](#).

$$C_{OUT(min)} > \frac{t_{ON}}{2} \times \frac{8\tau}{L_{OUT}} \times \frac{V_{REF}}{V_{OUT}}$$

where

- $C_{OUT(min)}$  is the minimum output capacitance needed to meet the stability requirement of the design
- $t_{ON}$  is the on-time information based on the switching frequency and duty cycle (in this design, 133 ns)
- $\tau$  is the ramp compensation time constant of the design based on the switching frequency and duty cycle, (in this design, 13.45  $\mu$ s, refer to [Table 40](#))
- $L_{OUT}$  is the output inductance (in the design, 0.25  $\mu$ H)
- $V_{REF}$  is the user-selected reference voltage level (in this design, 1 V)
- $V_{OUT}$  is the output voltage (in this design, 1 V)

(6)

The minimum output capacitance calculated from [Equation 6](#) is 286  $\mu$ F. The stability is ensured when the amount of the output capacitance is 286  $\mu$ F or greater. And when all MLCCs (multi-layer ceramic capacitors) are used, both DC and AC derating effects must be considered to guarantee that the minimum output capacitance requirement is met with sufficient margin.

#### 8.2.3.3.2 Response to a Load Transient

The output capacitance must supply the load with the required current when current is not immediately provided by the regulator. When the output capacitor supplies load current, the impedance of the capacitor greatly affects the magnitude of voltage deviation (such as undershoot and overshoot) during the transient.

Use [Equation 7](#) and [Equation 8](#) to estimate the amount of capacitance needed for a given dynamic load step and release.

#### NOTE

There are other factors that can impact the amount of output capacitance for a specific design, such as ripple and stability.

$$C_{OUT(min\_under)} = \frac{L_{OUT} \times (\Delta I_{LOAD(max)})^2 \times \left( \frac{V_{OUT} \times t_{SW}}{V_{IN(min)}} + t_{OFF(min)} \right)}{2 \times \Delta V_{LOAD(insert)} \times \left( \left( \frac{V_{IN(min)} - V_{OUT}}{V_{IN(min)}} \right) \times t_{SW} - t_{OFF(min)} \right) \times V_{OUT}}$$

(7)

$$C_{OUT(min\_over)} = \frac{L_{OUT} \times (\Delta I_{LOAD(max)})^2}{2 \times \Delta V_{LOAD(release)} \times V_{OUT}}$$

where

- $C_{OUT(min\_under)}$  is the minimum output capacitance to meet the undershoot requirement
- $C_{OUT(min\_over)}$  is the minimum output capacitance to meet the overshoot requirement
- $L$  is the output inductance value (0.25  $\mu$ H)
- $\Delta I_{LOAD(max)}$  is the maximum transient step (24 A)
- $V_{OUT}$  is the output voltage value (1 V)
- $t_{SW}$  is the switching period (1.6  $\mu$ s)
- $V_{IN(min)}$  is the minimum input voltage for the design (10.8 V)
- $t_{OFF(min)}$  is the minimum off time of the device (150 ns)
- $\Delta V_{LOAD(insert)}$  is the undershoot requirement (30 mV)
- $\Delta V_{LOAD(release)}$  is the overshoot requirement (30 mV)

(8)

Most of the above parameters can be found in [Table 39](#).

The minimum output capacitance to meet the undershoot requirement is 963  $\mu$ F. The minimum output capacitance to meet the overshoot requirement is 2400  $\mu$ F. This example uses a combination of POSCAP and MLCC capacitors to meet the overshoot requirement.

- POSCAP bank #1: 4 x 470  $\mu$ F, 2.5 V, 6 m $\Omega$  per capacitor
- MLCC bank #2: 10 x 100  $\mu$ F, 2.5 V, 1 m $\Omega$  per capacitor with DC+AC derating factor of 60%

Recalculating the worst case overshoot using the described capacitor bank design, the overshoot is 29.0 mV which meets the 30 mV overshoot specification requirement.

### 8.2.3.3.3 Output Voltage Ripple

The output voltage ripple is another important design consideration. [Equation 9](#) calculates the minimum output capacitance required to meet the output voltage ripple specification. This criterion is the requirement when the impedance of the output capacitance is dominated by ESR.

$$C_{OUT(min)RIPPLE} = \frac{I_{RIPPLE}}{8 \times f_{SW} \times V_{OUT(ripple)}} = 108 \mu F$$

(9)

In this case, the maximum output voltage ripple is 10 mV. For this requirement, the minimum capacitance for ripple requirement yields 108  $\mu$ F. Because this capacitance value is significantly lower compared to that of transient requirement, determine the capacitance bank from steps in the previous section [Response to a Load Transient](#). Because the output capacitor bank consists of both POSCAP and MLCC type capacitors, it is important to consider the ripple effect at the switching frequency due to effective ESR. Use [Equation 10](#) to determine the maximum ESR of the output capacitor bank for the switching frequency.

$$ESR_{MAX} = \frac{V_{OUT(ripple)} - \frac{I_{RIPPLE}}{8 \times f_{SW} \times C_{OUT}}}{I_{RIPPLE}} = 1.7 m\Omega$$

(10)

Estimate the effective ESR at the switching frequency by obtaining the impedance vs. frequency characteristics of the output capacitors. The parallel impedance of capacitor bank #1 and capacitor bank #2 at the switching frequency of the design example is estimated to be 1.2 m $\Omega$ , which is less than that of the maximum ESR value. Therefore, the output voltage ripple requirement (7 mV) can be met. For detailed calculation on the effective ESR please contact the factory to obtain a user-friendly Excel based design tool.

### 8.2.3.4 Input Capacitor Selection

The TPS549D22 devices require a high-quality, ceramic, type X5R or X7R, input decoupling capacitor with a value of at least 1  $\mu\text{F}$  of effective capacitance on the VDD pin, relative to AGND. The power stage input decoupling capacitance (effective capacitance at the PVIN and PGND pins) must be sufficient to supply the high switching currents demanded when the high-side MOSFET switches on, while providing minimal input voltage ripple as a result. This effective capacitance includes any DC bias effects. The voltage rating of the input capacitor must be greater than the maximum input voltage. The capacitor must also have a ripple current rating greater than the maximum input current ripple to the device during full load. The input ripple current can be calculated using Equation 11.

$$I_{\text{CIN (rms)}} = I_{\text{OUT (max)}} \times \sqrt{\frac{V_{\text{OUT}}}{V_{\text{IN (min)}}} \times \frac{(V_{\text{IN (min)}} - V_{\text{OUT}})}{V_{\text{IN (min)}}}} = 16 \text{ Arms} \quad (11)$$

The minimum input capacitance and ESR values for a given input voltage ripple specification,  $V_{\text{IN(ripple)}}$ , are shown in Equation 12 and Equation 13. The input ripple is composed of a capacitive portion,  $V_{\text{RIPPLE(cap)}}$ , and a resistive portion,  $V_{\text{RIPPLE(esr)}}$ .

$$C_{\text{IN (min)}} = \frac{I_{\text{OUT (max)}} \times V_{\text{OUT}}}{V_{\text{RIPPLE (cap)}} \times V_{\text{IN (max)}} \times f_{\text{SW}}} = 38.5 \mu\text{F} \quad (12)$$

$$\text{ESR}_{\text{CIN (max)}} = \frac{V_{\text{RIPPLE(ESR)}}}{I_{\text{OUT (max)}} + \left(\frac{I_{\text{RIPPLE}}}{2}\right)} = 7 \text{ m}\Omega \quad (13)$$

The value of a ceramic capacitor varies significantly over temperature and the amount of DC bias applied to the capacitor. The capacitance variations due to temperature can be minimized by selecting a dielectric material that is stable over temperature. X5R and X7R ceramic dielectrics are usually selected for power regulator capacitors because they have a high capacitance to volume ratio and are fairly stable over temperature. The input capacitor must also be selected with the DC bias taken into account. For this example design, a ceramic capacitor with at least a 25-V voltage rating is required to support the maximum input voltage. For this design, allow 0.1-V input ripple for  $V_{\text{RIPPLE(cap)}}$ , and 0.3-V input ripple for  $V_{\text{RIPPLE(esr)}}$ . Using Equation 12 and Equation 13, the minimum input capacitance for this design is 38.5  $\mu\text{F}$ , and the maximum ESR is 9.4  $\text{m}\Omega$ . For this example, four 22- $\mu\text{F}$ , 25-V ceramic capacitors and one additional 100- $\mu\text{F}$ , 25-V low-ESR polymer capacitors in parallel were selected for the power stage.

### 8.2.3.5 Bootstrap Capacitor Selection

A ceramic capacitor with a value of 0.1  $\mu\text{F}$  must be connected between the BOOT and SW pins for proper operation. It is recommended to use a ceramic capacitor with X5R or better grade dielectric. Use a capacitor with a voltage rating of 25 V or higher.

### 8.2.3.6 BP Pin

Bypass the BP pin to DRGND with 4.7- $\mu\text{F}$  of capacitance. In order for the regulator to function properly, it is important that these capacitors be localized to the TPS549D22, with low-impedance return paths. See [Layout Guidelines](#) section for more information.

### 8.2.3.7 R-C Snubber and VIN Pin High-Frequency Bypass

Though it is possible to operate the TPS549D22 within absolute maximum ratings without ringing reduction techniques, some designs may require external components to further reduce ringing levels. This example uses two approaches: a high frequency power stage bypass capacitor on the VIN pins, and an R-C snubber between the SW area and GND.

The high-frequency VIN bypass capacitor is a lossless ringing reduction technique which helps minimizes the outboard parasitic inductances in the power stage, which store energy during the low-side MOSFET on-time, and discharge once the high-side MOSFET is turned on. For this example two 2.2-nF, 25-V, 0603-sized high-frequency capacitors are used. The placement of these capacitors is critical to its effectiveness. Its ideal placement is shown in [Figure 52](#).

Additionally, an R-C snubber circuit is added to this example. To balance efficiency and spike levels, a 1-nF capacitor and a 1-Ω resistor are chosen. In this example a 0805-sized resistor is chosen, which is rated for 0.125 W, nearly twice the estimated power dissipation. See [SLUP100](#) for more information about snubber circuits.

### 8.2.3.8 Optimize Reference Voltage (VSEL)

Optimize the reference voltage by choosing a value for  $R_{VSEL}$ . The TPS549D22 device is designed with a wide range of precision reference voltage support from 0.6 V to 1.2 V with an available step change of 50 mV. Program these reference voltages using the VSEL pin strap configurations. Please refer to [Table 2](#) for internal reference voltage selections. In addition to providing initial boot voltage value, use the VSEL pin to program hiccup and latch-off mode.

There are two ways to program the output voltage set point. If the output voltage set point is one of the 16 available reference and boot voltage options, no feedback resistors are required for output voltage programming. In the case where feedback resistors are not needed, connect the RSP pin to the positive sensing point of the load. Always connect the RSN pin to the load return sensing point.

In this design example, since the output voltage set point is 1 V, select  $R_{VSEL(LS)}$  of either 75 kΩ (latch off) or 68.1 kΩ (hiccup) as shown in [Table 3](#). If the output voltage set point is NOT one of the 16 available reference or boot voltage options, feedback resistors are required for output voltage programming. Connect the RSP pin to the mid-point of the resistor divider. Always connect the RSN pin to the load return sensing point as shown in [Figure 27](#) and [Figure 28](#).

The general guideline to select boot and internal reference voltage is to select the reference voltage closest to the output voltage set point. In addition, because the RSP and RSN pins are extremely high-impedance input terminals of the true differential remote sense amplifier, use a feedback resistor divider with values much less than 100 kΩ.

### 8.2.3.9 MODE Pin Selection

MODE pin strap configuration is used to program control topology and internal soft-start timing selections. TPS549D22 supports both DCAP3 and DCAP operation. For general POL applications, it is strongly recommended to configure the control topology to be DCAP3 due to its simple to use and no external compensation features. In the rare instance where DCAP is needed, an RCC network across the output inductor is needed to generate sufficient ripple voltage on the RSP pin. In this design example,  $R_{MODE(LS)}$  of 42.2 kΩ is selected for DCAP3 and soft start time of 1 ms.

### 8.2.3.10 ADDR Pin Selection

ADDR pin strap configuration is used to program device address and light load conduction mode selection. The TPS549D22 allows up to 16 different chip addresses for PMBus communication with the first 3 bits fixed as 001. The address selection process is defined by resistor divider ratio from BP pin to ADDR pin, and the address detection circuit will start to work only after the initial power up when VDD has risen above its UVLO threshold.

For this application example, a device address of 16d is desired. We select the low side RADDR to be 0 Ohm considering the SKIP operation and device address of 16d. [Table 4](#) lists all combinations of the address selections. The 1% or better tolerance resistors with typical temperature coefficient of +/-100ppm/°C are recommended

### 8.2.3.11 Overcurrent Limit Design.

The TPS549D22 device uses the ILIM pin to set the OCP level. Connect the ILIM pin to GND through the voltage setting resistor,  $R_{ILIM}$ . In order to provide both good accuracy and cost effective solution, this device supports temperature compensated MOSFET on-resistance ( $R_{DS(on)}$ ) sensing. Also, this device performs both positive and negative inductor current limiting with the same magnitudes. Positive current limit is normally used to protect the inductor from saturation therefore causing damage to the high-side and low-side FETs. Negative current limit is used to protect the low-side FET during OVP discharge.

The inductor current is monitored by the voltage between PGND pin and SW pin during the OFF time. The ILIM pin has 3000 ppm/°C temperature slope to compensate the temperature dependency of the on-resistance. The PGND pin is used as the positive current sensing node.

TPS549D22 has cycle-by-cycle over-current limiting control. The inductor current is monitored during the OFF state and the controller maintains the OFF state during the period that the inductor current is larger than the overcurrent ILIM level. The voltage on the ILIM pin ( $V_{ILIM}$ ) sets the valley level of the inductor current. The range of value of the  $R_{ILIM}$  resistor is between 21 k $\Omega$  and 237 k $\Omega$ . The range of valley OCL is between 6.25 A and 75 A (typical). If the  $R_{ILIM}$  resistance is outside of the recommended range, OCL accuracy and function cannot be guaranteed. (see [Table 41](#))

**Table 41. Closed Loop EVM Measurement of OCP Settings**

| $R_{ILIM}$<br>(k $\Omega$ ) | OVERCURRENT PROTECTION VALLEY (A) |      |     |
|-----------------------------|-----------------------------------|------|-----|
|                             | MIN                               | NOM  | MAX |
| 237                         | —                                 | 75   | —   |
| 127                         | 36                                | 40   | 44  |
| 95.3                        | 27                                | 30   | 33  |
| 63.4                        | 18                                | 20   | 22  |
| 32.4                        | 9                                 | 10   | 11  |
| 21                          | —                                 | 6.25 | —   |

Use [Equation 14](#) to relate the valley OCL to the  $R_{ILIM}$  resistance.

$$OCL_{VALLEY} = 0.3178 \times R_{ILIM} - 0.3046$$

where

- $R_{ILIM}$  is in k $\Omega$
  - $OCL_{VALLEY}$  is in A
- (14)

In this design example, the desired valley OCL is 43 A, the calculated  $R_{ILIM}$  is 137 k $\Omega$ . Use [Equation 15](#) to calculate the DC OCL to be 46 A.

$$OCL_{DC} = OCL_{VALLEY} + 0.5 \times I_{RIPPLE}$$

where

- $R_{ILIM}$  is in k $\Omega$
  - $OCL_{DC}$  is in A
- (15)

In an overcurrent condition, the current to the load exceeds the inductor current and the output voltage falls. When the output voltage crosses the under-voltage fault threshold for at least 1msec, the behavior of the device depends on the VSEL pin strap setting. If hiccup mode is selected, the device will restart after 16-ms delay (1-ms soft-start option). If the overcurrent condition persists, the OC hiccup behavior repeats. During latch-off mode operation the device shuts down until the EN pin is toggled or VDD pin is power cycled.

## 9 Power Supply Recommendations

This device is designed to operate from an input voltage supply between 1.5 V and 16 V. Ensure the supply is well regulated. Proper bypassing of input supplies and internal regulators is also critical for noise performance, as is the quality of the PCB layout and grounding scheme. See the recommendations in the [Layout](#) section.

## 10 Layout

### 10.1 Layout Guidelines

Consider these layout guidelines before starting a layout work using TPS549D22.

- It is absolutely critical that all GND pins, including AGND (pin 30), DRGND (pin 29), and PGND (pins 13, 14, 15, 16, 17, 18, 19, and 20) are connected directly to the thermal pad underneath the device via traces or plane.
- Include as many thermal vias as possible to support a 40-A thermal operation. For example, a total of 35 thermal vias are used (outer diameter of 20 mil) in the available for purchase at ti.com.
- Place the power components (including input/output capacitors, output inductor and device) on one side of the PCB (solder side). Insert at least two inner layers (or planes) connected to the power ground, in order to shield and isolate the small signal traces from noisy power lines.
- Place the VIN pin decoupling capacitors as close to the PVIN and PGND pins as possible to minimize the input AC current loop. Place a high-frequency decoupling capacitor (with a value between 1 nF and 0.1  $\mu$ F) as close to the PVIN pin and PGND pin as the spacing rule allows. This placement helps suppress the switch node ringing.
- Place VDD and BP decoupling capacitors as close to the device pins as possible. Do not use PVIN plane connection for the VDD pin. Separate the VDD signal from the PVIN signal by using separate trace connections. Provide GND vias for each decoupling capacitor and make the loop as small as possible.
- Ensure that the PCB trace defined as switch node (which connects the SW pins and up-stream of the output inductor) are as short and wide as possible. In the EVM design, the SW trace width is 200 mil. Use a separate via or trace to connect SW node to snubber and bootstrap capacitor. Do not combine these connections.
- Place all sensitive analog traces and components (including VOSNS, RSP, RSN, ILIM, MODE, VSEL and ADDR) far away from any high voltage switch node (itself and others), such as SW and BOOT to avoid noise coupling. In addition, place MODE, VSEL and ADDR programming resistors near the device pins.
- The RSP and RSN pins operate as inputs to a differential remote sense amplifier that operates with very high impedance. It is essential to route the RSP and RSN pins as a pair of diff-traces in Kelvin-sense fashion. Route them directly to either the load sense points (+ and –) or the output bulk capacitors. The internal circuit uses the VOSNS pin for on-time adjustment. It is critical to tie the VOSNS pin directly tied to VOUT (load sense point) for accurate output voltage result.

## Layout Example (continued)

### 10.2.1 Mounting and Thermal Profile Recommendation

Proper mounting technique adequately covers the exposed thermal tab with solder. Excessive heat during the reflow process can affect electrical performance. [Figure 69](#) shows the recommended reflow oven thermal profile. Proper post-assembly cleaning is also critical to device performance. See the Application Report, *QFN/SON PCB Attachment*, ([SLUA271](#)) for more information.

**Figure 69. Recommended Reflow Oven Thermal Profile**

**Table 42. Recommended Thermal Profile Parameters**

| PARAMETER                    |                                                                 | MIN | TYP | MAX | UNIT |
|------------------------------|-----------------------------------------------------------------|-----|-----|-----|------|
| <b>RAMP UP AND RAMP DOWN</b> |                                                                 |     |     |     |      |
| $r_{\text{RAMP(up)}}$        | Average ramp-up rate, $T_{\text{S(max)}}$ to $T_{\text{P}}$     |     |     | 3   | °C/s |
| $r_{\text{RAMP(down)}}$      | Average ramp-down rate, $T_{\text{P}}$ to $T_{\text{S(max)}}$   |     |     | 6   | °C/s |
| <b>PRE-HEAT</b>              |                                                                 |     |     |     |      |
| $T_{\text{S}}$               | Pre-heat temperature                                            | 150 |     | 200 | °C   |
| $t_{\text{S}}$               | Pre-heat time, $T_{\text{S(min)}}$ to $T_{\text{S(max)}}$       | 60  |     | 180 | s    |
| <b>REFLOW</b>                |                                                                 |     |     |     |      |
| $T_{\text{L}}$               | Liquidus temperature                                            |     | 217 |     | °C   |
| $T_{\text{P}}$               | Peak temperature                                                |     |     | 260 | °C   |
| $t_{\text{L}}$               | Time maintained above liquidus temperature, $T_{\text{L}}$      | 60  |     | 150 | s    |
| $t_{\text{P}}$               | Time maintained within 5 °C of peak temperature, $T_{\text{P}}$ | 20  |     | 40  | s    |
| $t_{25\text{P}}$             | Total time from 25 °C to peak temperature, $T_{\text{P}}$       |     |     | 480 | s    |

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 11.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 11.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

**TI E2E™ Online Community** *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 11.4 Trademarks

D-CAP3, Eco-mode, NexFET, E2E are trademarks of Texas Instruments.

PMBus is a trademark of SMIF, Inc..

All other trademarks are the property of their respective owners.

#### 11.5 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

#### 11.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

| Orderable Device | Status<br>(1) | Package Type | Package<br>Drawing | Pins | Package<br>Qty | Eco Plan<br>(2)          | Lead/Ball Finish<br>(6) | MSL Peak Temp<br>(3) | Op Temp (°C) | Device Marking<br>(4/5) | Samples                 |
|------------------|---------------|--------------|--------------------|------|----------------|--------------------------|-------------------------|----------------------|--------------|-------------------------|-------------------------|

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

RVF (R-PLQFN-N40)

PLASTIC QUAD FLATPACK NO-LEAD

4211383/C 04/12

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
  - This drawing is subject to change without notice.
  - Quad Flatpack, No-leads (QFN) package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - Falls within JEDEC MO-220.

## THERMAL PAD MECHANICAL DATA

RVF (R-PLQFN-N40)

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4211460-2/G 03/15

NOTE: All linear dimensions are in millimeters

RVF (R-PLQFN-N40)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in the thermal pad.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
