The **66013** dual channel optocoupler consists of two LED's optically coupled to two high speed, high gain inverting detector gates. Maximum isolation can be achieved while providing TTL outputs capable of switching with propagation delays of 55ns typical. The 66013 is a 16 pin dual-in-line, hermetically sealed package and is available in standard and MIL-PRF-38534 screened versions or tested to customer specifications.

NOTES:

- Each channel
- Measured between pins 1 through 8 shorted together and pins 9 through 16 shorted together.
- Measured between pins 9 and 10 or 11 and 12 shorted together, and pins 9 through 16 shorted together.
- Measured between pins 9 and 10 shorted together, and pins 11 and 12 shorted together.
- The t_{ph} propagation delay is measured from the 6.5mA point on the trailing edge of the input pulse to the 1.5V point on the trailing edge of the output pulse.
- The t_{phi} propagation delay is measured from the 6.5mA point on the leading edge of the input pulse to the 1.5V point on the leading edge of the output pulse.
- CM_h is the max tolerable common mode transient to assure that the output will remain in a high logic state (i.e. $V_o > 2.0\text{V}$).
- CM_l is the max. tolerable common mode transient to assure that the output will remain in a low logic state (i.e. $V_o < 0.8\text{V}$).
- It is essential that a bypass capacitor (.01 to 0.1 μF ceramic) be connected from pin 10 to pin 15.
