**Note 1:** "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the devices should be operated at these limits. The tables of "Recommended Operating Conditions" and "Electrical Characteristics" provide conditions for actual device operation.

**Note 2:**  $V_{SS} = 0\text{V}$  unless otherwise specified.

**Note 3:** These devices should not be connected to circuits with the power "ON".

**Note 4:** In all cases, there is approximately 5 pF of probe and jig capacitance in the output; however, this capacitance is included in  $C_L$  wherever it is specified.

**Note 5:**  $V_{IS}$  is the voltage at the in/out pin and  $V_{OS}$  is the voltage at the out/in pin.  $V_C$  is the voltage at the control input.

**Note 6:** Conditions for  $V_{IHC}$ : a)  $V_{IS} = V_{DD}$ ,  $I_{OS}$  = standard B series  $I_{OH}$  b)  $V_{IS} = 0\text{V}$ ,  $I_{OL}$  = standard B series  $I_{OL}$ .

## Special Considerations

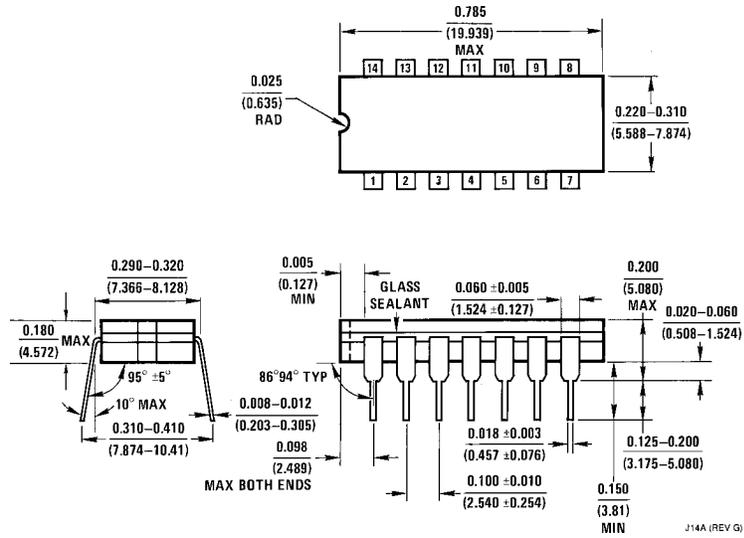

In applications where separate power sources are used to drive  $V_{DD}$  and the signal input, the  $V_{DD}$  current capability should exceed  $V_{DD}/R_L$  ( $R_L$  = effective external load of the 4 CD4066BM/CD4066BC bilateral switches). This provision avoids any permanent current flow or clamp action of the  $V_{DD}$  supply when power is applied or removed from CD4066BM/CD4066BC.

In certain applications, the external load-resistor current may include both  $V_{DD}$  and signal-line components. To avoid

drawing  $V_{DD}$  current when switch current flows into terminals 1, 4, 8 or 11, the voltage drop across the bidirectional switch must not exceed 0.6V at  $T_A \leq 25^\circ\text{C}$ , or 0.4V at  $T_A > 25^\circ\text{C}$  (calculated from  $R_{ON}$  values shown).

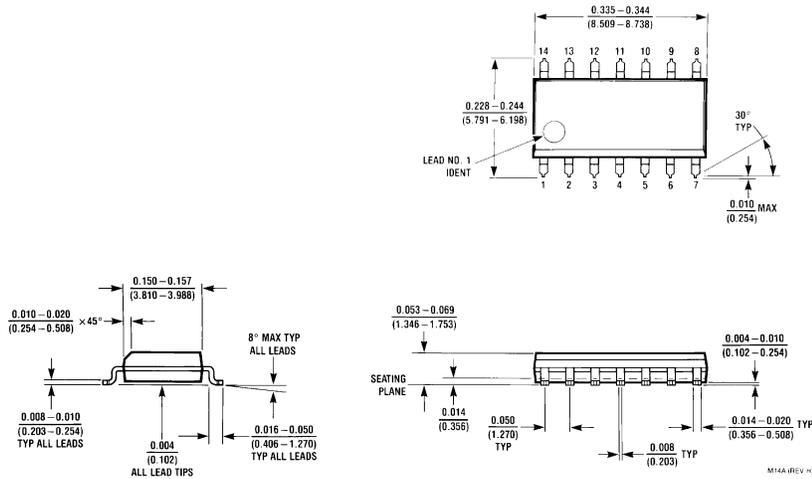

No  $V_{DD}$  current will flow through  $R_L$  if the switch current flows into terminals 2, 3, 9 or 10.
