RED HDSP2000LP YELLOW HDSP2001LP HIGH EFFICIENCY RED HDSP2002LP GREEN HDSP2003LP

.150" 4-Character 5x7 Dot Matrix Serial Input Alphanumeric Display

FEATURES

- Four 0.150" Dot Matrix Characters
- Four Colors: Red, Yellow, High Efficiency Red, Green
- Wide Viewing Angle: X Axis +50° Y Axis +75°
- Built-in CMOS Shift Registers with Constant Current LED Row Drivers
- Shift Registers Allow Custom Fonts
- Easily Cascaded for Multiple Displays
- TTL Compatible
- End Stackable
- Extended Operating Temperature Range:
 -40°C to + 85°C
- Categorized for Luminous Intensity
- All Displays Color Matched
- Compact Plastic Package
- 100% Burned In and Tested

DESCRIPTION

The HDSP200XLP are four digit 5x7 dot matrix serial input alphanumeric displays. The displays are available in red, yellow, high efficiency red, or bright green. The package is a standard twelve-pin DIP with a flat plastic lens. The display can be stacked horizontally or vertically to form messages of any length.

The HDSP200XLP has two fourteen-bit CMOS shift registers with built-in row drivers. These shift registers drive twenty-eight rows and enable the design of customized fonts. Cascading multiple displays is possible because of the Data In and Data Out pins. Data In and Out are easily input with the clock signal and displayed in parallel on the row drivers. Data Out represents the output of the 7th bit of digit number four shift register The shift register is level triggered. The like columns of each character in a display cluster are tied to a single pin (see Block Diagram). High true data in the shift register enables the output current mirror driver stage associated with each row of LEDs in the 5x7 diode array.

The TTL compatible $V_{\rm B}$ input may either be tied to $V_{\rm CC}$ for maximum display intensity or pulse width modulated to achieve intensity control and reduce power consumption.

DESCRIPTION (Continued)

In the normal mode of operation, input data for digit four, column one is loaded into the seven on-board shift register locations one through seven. Column one data for digits 3, 2, and 1 is shifted into the display shift register locations. Then column one input is enabled for an appropriate period of time, T. A similar process is repeated for columns 2, 3, 4, and 5. If the decode time and load data time into the shift register is t, then with five columns, each column of the display is operating at a duty factor of:

$$DF = \frac{T}{5(T+t)}$$

T+t, allotted to each display column, is generally chosen to provide the maximum duty factor consistent with the minimum refresh rate necessary to achieve a flicker free display. For most strobed display systems, each column of the display should be refreshed (turned on) at a minimum rate of 100 times per second.

With columns to be addressed, this refresh rate then gives a value for the time T+t of: 1/5x(100)] =2 msec. If the device is operated at 5.0 MHz clock rate maximum, it is possible to maintain t<<T. For short display strings, the duty factor will then approach 20%.

Maximum Ratings

Supply Voltage V _{CC} to GND0.5 V	to + 7.0 V
Inputs, Data Out and V _B 0.5 V to V	cc + 0.5 V
Column Input Voltage, V _{COL} 0.5 V	to + 6.0 V
Operating Temperature Range40°C	to +85°C
Storage Temperature Range40°C t	o + 100°C
Maximum Solder Temperature, 0.063" (1.59 mm	1)
below Seating Plane, t<5 sec	260°C
Maximum Allowable Power Dissipation	
at T _{amb} =25 C ^{o(1)}	0.86 W
W-110	

Note:

 Maximum allowable dissipation is derived from V_{CC}=5.25 V, V_B=2.4 V, V_{COL}=3.5 V, 20 LEDs on per character, 20% DF.

Cleaning the Displays

IMPORTANT—Do not use cleaning agents containing alcohol of any type with this display. The least offensive cleaning solution is hot D.I. water (60°C) for less than 15 minutes. Addition of mild saponifiers is acceptable. Do not use commercial dishwasher detergents.

For post solder cleaning use water or non-alcohol mixtures formulated for vapor cleaning processing or non-alcohol mixtures formulated for room temperature cleaning. Nonalcohol vapor cleaning processing for up to two minutes in vapors at boiling is permissible. For suggested solvents refer to Siemens Appnote 19.

- 1. The displays are categorized for luminous intensity with the intensity category designated by a letter code on the bottom of the package.
- 2. Dominant wavelength (λD) is derived from the CIE chromaticity diagram and represents the single wavelength which defines the color of the device
- 3. The luminous sterance of the LED may be calculated using the following relationships:
 - L_V (cd/m²) = I_V (Candela)/A (Meter)² L_V (Footlamberts) = πI_V (Candela)/A (Foot)²
- HDSP2000LP, A = $5.58 \times 10^{-8} \, \text{m}^2 = 6 \times 10^{-7} \, \text{ft.}^2$ HDSP2001/2/3LP, A = $7.8 \times 10^{-8} \, \text{m}^2 = 8.4 \times 10^{-7} \, \text{ft.}^2$ 4. All typical values specified at $V_{CC} = 5.0 \, \text{V}$ and $T_{amb} = 25^{\circ} \text{C}$ unless otherwise noted.

General Quality Assurance Levels

Generic data available.

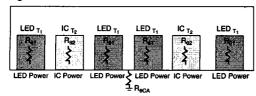

Thermal Considerations

The small alphanumeric displays are hybrid LED and CMOS assemblies that are designed for reliable operation in commercial, industrial, and military environments. Optimum reliability and optical performance will result when the junction temperature of the LEDs and CMOS ICs are kept as low as possible.

Thermal Modeling

HDSP200XLP displays consist of two driver ICs and four 5x7 LED matrixes. A thermal model of the display is shown in Figure 5. It illustrates that the junction temperature of the semiconductor = junction self heating + the case temperature rise + the ambient temperature. Equation 1 shows this relationship.

Figure 5. Thermal Model

See Equation 1 below.

The junction rise within the LED is the product of the thermal impedance of an individual LED (37°C/W, DF = 20%, F = 200 Hz), times the forward voltage, $V_{F(LED)}$ and forward current $I_{\text{F(LED)}}$, of 13 - 14.5 mA. This rise averages $T_{\text{J(LED)}} = 1^{\circ}\text{C}$. The table below shows the $V_{\text{F(LED)}}$ for the respective displays.

Model Number		VF	
	Min.	Тур.	Max.
HDSP2000LP	1.6	1.7	2.0
HDSP2001/2/3LP	1.9	2.2	3.0

The junction rise within the LED driver IC is the combination of the power dissipated by the IC quiescent current and the 28 row driver current sinks. The IC junction rise is given in Equation 2.

A thermal resistance of 28°C/W results in a typical junction rise of 6°C.

See Equation 2 below.

For ease of calculations the maximum allowable electrical operating condition is dependent upon the aggregate thermal resistance of the LED matrixes and the two driver ICs. All of the thermal management calculations are based upon the parallel combination of these two networks which is 15°C/W. Maximum allowable power dissipation is given in Equation 3.

DF

Equation 3.
$$P_{DISPLAY} = \frac{T_{J(MAX)} - T_A}{R_{BJC} + R_{BCA}}$$

$$P_{DISPLAY} = 5 V_{COL} I_{COL} (n/35) DF + V_{CC} I_{CC}$$

For further reference see Figures 2, 7, 8, 9, 10 and 11.

Optical Considerations

The light output of the LEDs is inversely related to the LED diode's junction temperature as shown in Figure 6. For optimum light output, keep the thermal resistance of the socket or PC board as low as possible.

Figure 6. Normalized Luminous Intensity versus Junction Temperature

When mounted in a 10°C/W socket and operated at Absolute Maximum Electrical conditions, the HDSP200XLP will show anLED junction rise of 17°C. If $T_A = 40$ °C, then the LED's TJ will be 57°C. Under these conditions Figure 7 shows that the I_{ν} will be 75% of its 25°C value.
