Operational Description

1. CPU Core Functions

The CPU core consists of a CPU, a system clock controller, an interrupt controller, and a watchdog timer.

This section provides a description of the CPU core, the program memory (ROM), the data memory (RAM), and the reset circuit.

1.1 Memory Address Map

TLCS-870/X Series, the memory is organized 4 address spaces (ROM, RAM, SFR, and DBR). Figure 1.1.1 shows the memory address maps of the TMP88CU74. It uses a memory mapped I/O system, and all I/O registers are mapped in the SFR/DBR address spaces. There are 16 banks of general-purpose registers.

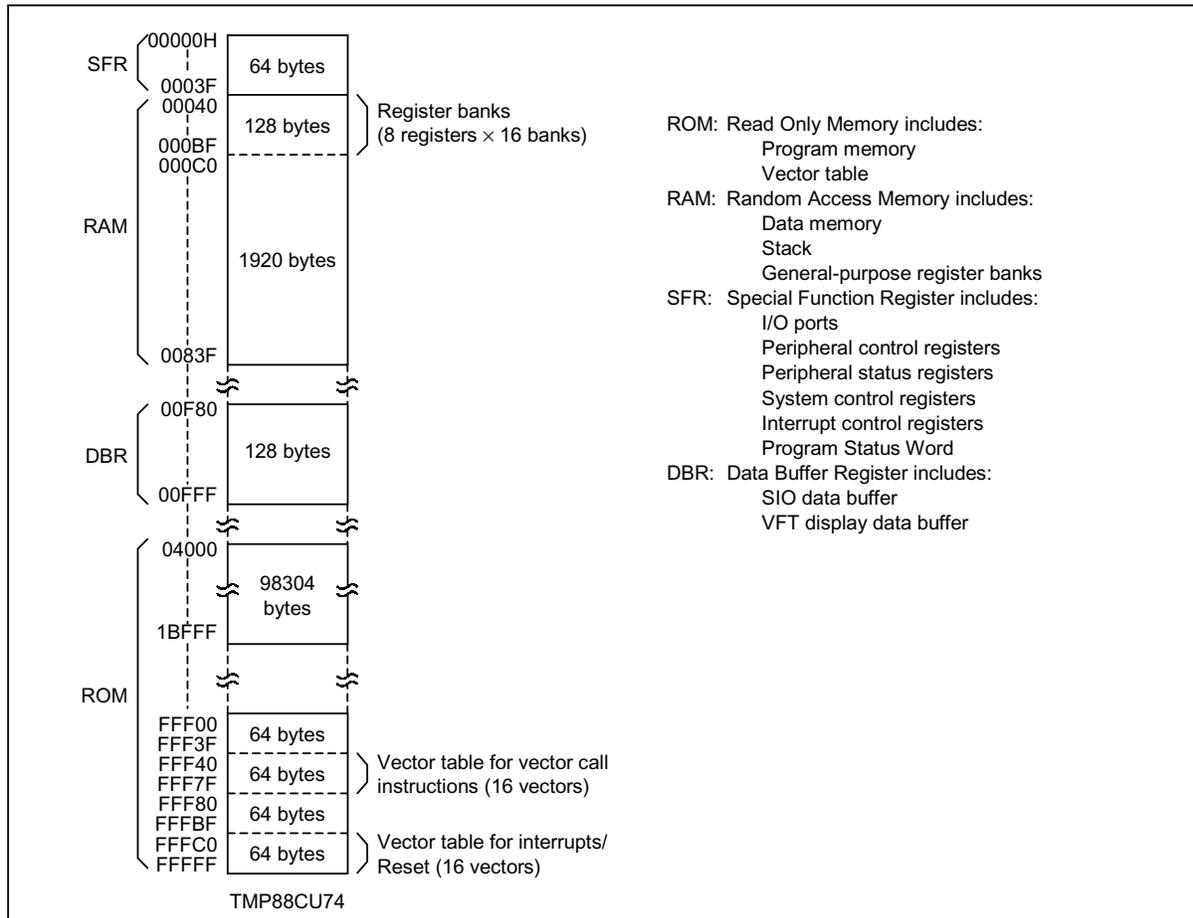

Figure 1.1.1 Memory Address Maps

1.2 Program Memory (ROM)

The TMP88CU74 has a 96 Kbytes (addresses 04000H to 1BFFFH) and 256 bytes (addresses FFF00H to FFFFFH) of program memory (mask programmed ROM). Figure 1.1.1 shown in Memory address maps.

Addresses FFF00H to FFFFFH in the program memory can also be used for special purposes.

Note 1: The absolute maximum ratings are rated values which must not be exceeded during operation, even for an instant. Any one of the ratings must not be exceeded. If any absolute maximum rating is exceeded, a device may break down or its performance may be degraded, causing it to catch fire or explode resulting in injury to the user. Thus, when designing products which include this device, ensure that no absolute maximum rating value will ever be exceeded.

Note 2: Power Dissipation (PD); For PD, it is necessary to decrease 14.3 mW/ $^\circ\text{C}$.

		XTIN, XTOUT	$V_{DD} = 2.7$ to 5.5 V	30.0	34.0	kHz

Note 1: The recommended operating conditions for a device are operating conditions under which it can be guaranteed that the device will operate as specified. If the device is used under operating conditions other than the recommended operating conditions (Supply voltage, Operating temperature range, Specified AC/DC values etc.), malfunction may occur. Thus, when designing products which include this device, ensure that the recommended operating conditions for the device are always adhered to.

Note 2: Clock frequency f_c : Supply voltage range is specified in NORMAL 1/2 mode and IDLE 1/2 mode.

How to Calculate Power Consumption.

With the TMP88CU74, a pull-down resistor ($R_K = 80 \text{ k}\Omega$ typ.) can be built into a VFT driver using mask option (port by port). The share of VFT driver loss (VFT driver output loss + pull-down resistor (R_K) loss) in power consumption P_{\max} is high. When using a fluorescent display tube with a large number of segments, the maximum power consumption P_D must not be exceeded.

Power consumption $P_{\max} =$ operating power consumption + normal output port loss + VFT driver loss

Where,

1. Operating power consumption: $V_{DD} \times I_{DD}$
2. Normal power consumption: $\Sigma I_{OUT2} \times 0.4$
3. VFT driver loss: VFT driver output loss + pull-down resistor (R_K) loss

Example:

When $T_a = 10$ to 50°C and a fluorescent display tube with segment output = 3 mA, digit output = 15 mA, $V_{xx} = -25 \text{ V}$ is used.

Operating conditions: $V_{DD} = 5 \text{ V} \pm 10\%$, $f_c = 12.5 \text{ MHz}$, VFT dimmer time (DIM) = $(14/16) \times t_{\text{seg}}$:

Power consumption $P_{\max} = (1) + (2) + (3)$

Where, segments pin = X grid pin = Y, Y = 2

1. Operating power consumption: $V_{DD} \times I_{DD} = 5.5 \text{ V} \times 20 \text{ mA} = 110 \text{ mW}$
2. Normal output port loss: $I_{OUT2} \times 0.4 \text{ V} = 120 \text{ mA} \times 0.4 \text{ V} = 48 \text{ mW}$
3. VFT driver loss: segment pin = $3 \text{ mA} \times 2 \text{ V} \times \text{number of segments X} = 6 \text{ mW} \times X \times \text{number of grids Y}$
 digit pin = $15 \text{ mA} \times 2 \text{ V} \times 14/16 \text{ (DIM)} = 52.5 \text{ mW}$
 R_K loss = $(5.5 + 25 \text{ V})^2 / 50 \text{ k}\Omega \times (\text{number of segments X} + \text{number of digits Y}) = 18.605 \text{ mW} \times (X + 2)$

$$\begin{aligned} \text{Therefore, } P_{\max} &= 110 \text{ mW} + 48 \text{ mW} + 6 \text{ mW} \times X + 52.5 \text{ mW} + 18.605 \text{ mW} \times (X + 2) \\ &= 253.71 \text{ mW} + 24.605 X \end{aligned}$$

Maximum power consumption P_D when $T_a = 50^\circ\text{C}$ is determined by the following equation:

$$\begin{aligned} P_D &> P_{\max} \\ 842.5 \text{ mW} &> 253.71 + 24.605 X \\ 23.9 &> X \end{aligned}$$

Thus, a fluorescent display tube with less than 23 segments can be used. If a fluorescent display tube with 23 segments or more is used, either a pull-down resistor must be attached externally, or the number of segments to be lit must be kept to less than 23 by software.
