

SIEMENS

RED PDSP2110

YELLOW PDSP2111

HIGH EFFICIENCY RED PDSP2112

GREEN PDSP2113

HIGH EFFICIENCY GREEN PDSP2114

**0.200" 8-Character, 5x7 Dot Matrix
Parallel Input Alphanumeric Intelligent Display™**

FEATURES

- Eight 0.200" Dot Matrix Characters in Red, Yellow, High Efficiency Red, Green, High Efficiency Green
- Built-in 2 Page, 256 Character ROM. Both pages are Mask Programmable for Custom Fonts
- Readable from 8 Feet (2.5 meters)
- Built-in Decoders, Multiplexers and Drivers
- Wide Viewing Angle, X Axis $\pm 55^\circ$, Y Axis $\pm 65^\circ$
- Programmable Features:
 - Individual Flashing Character
 - Full Display Blinking
 - Multi-Level Dimming and Blanking
 - Clear Function
 - Lamp Test
- Internal or External Clock
- End Stackable Dual-In-Line Plastic Package

Description

The PDSP2110 (Red), PDSP2111 (Yellow), PDSP2112 (High Efficiency Red), PDSP2113 (Green), PDSP2114 (High Efficiency Green), and PDSP2115 (Soft Orange) are eight digit, 5x7 dot matrix, parallel input, alphanumeric Intelligent Displays. The 0.20 inch high digits are packaged in a rugged, high quality, optically transparent, 0.6 inch lead spacing, 28 pin plastic DIP.

The on-board CMOS has a built-in 256 character ROM. Both pages are mask programmable for 256 custom characters. The first page of ROM of a standard product contains 128 characters including ASCII, selected European and Scientific symbols. The second page contains Katakana Japanese characters, more European characters, Avionics, and other graphic symbols.

The PSP211X is designed for standard microprocessor interface techniques, and is fully TTL compatible. The Clock I/O and Clock Select pins allow the user to cascade multiple display modules.

Maximum Rating,

Switching Specifications

(over operating temperature range and $V_{CC}=4.5$ V)

Symbol	Description	Min.	Units
Tbw	Time Between Writes	30	ns
Tacc ⁽²⁾	Display Access Time	130	ns
Tas	Address Setup Time	10	ns
Tces	Chip Enable Setup Time	0	ns
Tah	Address Hold Time	20	ns
Tceh	Chip Enable Hold Time	0	ns
Tw	Write Active Time	100	ns
Tds	Data Valid Prior to Rising Edge of Write	50	ns
Tdh	Data Hold Time	20	ns
Trc ⁽¹⁾	Reset Active Time	300	ns
Tclr ⁽³⁾	Clear Cycle Time	3	μs

1. Wait 300 ns min. after the reset function is turned off.
2. $T_{acc}=T_{as} + T_w + T_{ah}$
3. The Clear Cycle Time may be shortened by writing a second Control Word with the Clear Bit disabled, 160 ns after the first control word that enabled the Clear Bit.

*Notes:

1. All input voltages are ($V_{IL}=0.8$ V, $V_{IH}=2.0$ V).
2. These wave forms are not edge triggered.
3. $T_{bw}=T_{as} + T_{ah}$

Optical Characteristics at 25°C, $V_{CC}=5.0$ V at Full Brightness**Red PDSP2110**

Description	Symbol	Min.	Typ.	Units
Peak Luminous Intensity ⁽¹⁾	I_{Vpeak}	70	90	$\mu\text{cd}/\text{dot}$

Block Diagram

Functional Description

The PDSP211X block diagram is comprised of the following major blocks and registers.

Display Memory consists of a 8x8 bit RAM block. Each of the eight 8-bit words holds the 7-bit ASCII data (bit D0-D6). The 8th bit, D7 selects 1 of the 2 pages of character ROM. D7=0 selects Page 1 of the ROM and D7=1 selects Page 2 of the ROM. A3=1.

$\overline{\text{RST}}$ can be used to initialize display operation upon power up or during normal operation. When activated, $\overline{\text{RST}}$ will clear the Flash RAM and Control Word Register (00H) and reset the internal counter. All eight display memory locations will be set to 20H to show blanks in all digits.

$\overline{\text{FL}}$ pin enables access to the **Flash RAM**. The **Flash RAM** will set (D0=1) or reset (D0=0) flashing of the character addressed by A0-A2.

The 1x8 bit **Control Word RAM** is loaded with attribute data if A3=0.

The **Control Word Logic** decodes attribute data for proper implementation.

Character ROM is designed for two pages of 128 characters each. Both pages of the ROM are Mask Programmable for custom fonts. On the standard product page one contains standard ASCII, selected European characters and some scientific symbols. Page two contains Katakana characters, more European characters, avionics, and other graphic symbols.

The **Clock Source** could either be the internal oscillator ($\text{CLKSEL}=1$) of the device or an external clock ($\text{CLKSEL}=0$) could be an input from another PDSP211X display for the synchronization of blinking for multiple displays.

The **Display Multiplexer** controls the Row Drivers so no additional logic is required for a display system.

The **Display** has eight digits. Each digit has 35 LEDs clustered into a 5x7 dot matrix.

Theory of Operation

The PDSP211X Programmable display is designed to work with all major microprocessors. Data entry is via an eight bit parallel bus. Three bits of address route the data to the proper digit location in the RAM. Standard control signals like WR and CE allow the data to be written into the display.

D0 – D7 data bits are used for both ASCII and control word data input. A3 acts as the mode selector. If A3=0, D0 – D7 load the RAM with control word data. If A3=1, D0 – D7 will load the RAM with ASCII and page select data. In the later mode, D7=0 selects Page 1 of Character ROM and D7=1 selects Page 2 of Character ROM.

For normal operation $\overline{\text{FL}}$ pin should be held high. When $\overline{\text{FL}}$ is held low, Flash RAM is accessed to set character blinking.

The seven bit ASCII code is decoded by the Character ROM to generate Column data. Twenty columns worth of data is sent out each display cycle and it takes fourteen display cycles to write into eight digits.

The rows are being multiplexed in two sets of seven rows each. The internal timing and control logic synchronizes the turning on of rows and presentation of column data to assure proper display operation.

X = Don't care

Power up Sequence

Upon power up display will come on at random. Thus the display should be reset on power-up. The reset will clear the Flash RAM, Control Word Register and reset the internal counter. All the digits will show blanks and display brightness level will be 100%.

Microprocessor Interface

The interface to a microprocessor is through the 8-bit data bus (D0–D7), the 4-bit address bus (A0–A3) and control lines \overline{FL} , \overline{CE} and \overline{WR} .

To write data (ASCII/ Control Word) into the display \overline{CE} should be held low, address and data signals stable and \overline{WR} should be brought low.

The Control Word is decoded by the Control Word Decode Logic. Each code has a different function. The code for display brightness changes the duty cycle for the column drivers. The peak LED current stays the same but the average LED current diminishes depending on the intensity level.

The character Flash Enable causes 2 Hz coming out of the counter to be AND'ed with column drive signal and makes the column driver to cycle at 2 Hz. Thus the character flashes at 2 Hz.

The display Blink works the same way as the Flash Enable but causes all twenty column drivers to cycle at 2 Hz thereby making all eight digits to blink at 2 Hz.

The Lamp Test causes the column drivers to run at 1/2 duty cycle thus all the LEDs in all eight digits turn on at 50% intensity.

Clear bit clears the character RAM and writes a blank into the display memory. It however does not clear the control word.

ASCII Data or Control Word Data can be written into the display at this point. For multiple display operation, CLK I/O must be properly selected. CLK I/O will output the internal clock if $\overline{CLKSEL}=1$, or will allow input from an external clock if $\overline{CLKSEL}=0$.

Control Word Format

Display Brightness

The display can be programmed to vary between blank, 13%, 20%, 27%, 40%, 53%, 80% and full brightness. Bits D0, D1 and D2 control the display brightness.

\overline{CE}	\overline{WR}	\overline{FL}	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Display Brightness
0	0	1	0	X	X	X	0	0	X	X	X	0	0	0	100% Brightness

0	0	1	0	X	X	X	0	0	X	X	X	1	1	1	Blank Display

X = Don't Care

Flash RAM Function

Character Flash is controlled by \overline{FL} pin, bit D0 and control word bit D3. Combination of \overline{FL} being low, proper digit address and D0 being high will write a flash bit into the Flash RAM Register. In the control word mode when D3 is brought high, the above mentioned character will flash.

Setting the Flash Bit

\overline{CE}	\overline{WR}	\overline{FL}	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	0	X	A	A	A	X	X	X	X	X	X	X	0	Flash RAM Disabled
0	0	0	X	A	A	A	X	X	X	X	X	X	X	1	Flash RAM Enabled

X = Don't Care A = Selected Address

Character Flash Control Word

\overline{CE}	\overline{WR}	\overline{FL}	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	1	0	X	X	X	0	0	X	0	0	B	B	B	Disable Flashing Character
0	0	1	0	X	X	X	0	0	X	0	1	B	B	B	Enable Flashing Character

X = Don't Care B = Selected Brightness

Display Blinking

Blinking Function is independant of Flash function. When D4 is held high, entire display blinks at 2 Hz.

\overline{CE}	\overline{WR}	\overline{FL}	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	1	0	X	X	X	0	0	X	0	0	B	B	B	Display Blinking Disabled
0	0	1	0	X	X	X	0	0	X	1	0	B	B	B	Display Blinking Enabled

X = Don't Care B = Selected Brightness

Lamp Test

Bit D6 when brought high will cause all the LEDs in all eight digits to light up at 53% brightness. Selecting or de-selecting Lamp Test bit has no effect on the display memory.

\overline{CE}	\overline{WR}	\overline{FL}	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Operation
0	0	1	0	X	X	X	0	0	X	0	X	X	X	X	Lamp Test Disabled
0	0	1	0	X	X	X	0	1	X	0	0	X	X	X	Lamp Test Disabled

X = Don't Care

Clear Function

Clear function will clear the display. The Flash RAM will be set to all zeros. An ASCII blank code (20H) will be written into the display memory. The user must wait 3 ms or write a new control word to the display with control word bit D7 = 0 to disable clear before writing any data to the display memory, otherwise all new data to the display memory will remain cleared. See Switching Specifications for clear function timing.

$\overline{\text{CE}}$	$\overline{\text{WR}}$	$\overline{\text{FL}}$	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0	Operation

Electrical and Mechanical Considerations

Voltage Transient Suppression

For best results power the display and the components that interface with the display to avoid logic inputs higher than VCC. Additionally, the LEDs may cause transients in the power supply line while they change display states. The common practice is to place a parallel combination of a .01 μF and a 22 μF capacitor between VCC and GND for all display packages.

ESD Protection

The input protection structure of the PDSP2110/1/2/3/4 provides significant protection against ESD damage. It is capable of withstanding discharges greater than 2 KV. Take all the standard precautions, normal for CMOS components. These include properly grounding personnel, tools, tables, and transport carriers that come in contact with unshielded parts. If these conditions are not, or cannot be met, keep the leads of the device shorted together or the parts in anti-static packaging.

Soldering Considerations

The PDSP2110/1/2/3/4 can be hand soldered with SN63 solder using a grounded iron set to 260°C.

Wave soldering is also possible following these conditions: Preheat that does not exceed 93°C on the solder side of the PC board or a package surface temperature of 85°C. Water soluble organic acid flux (except carboxylic acid) or resin-based RMA flux without alcohol can be used.

Wave temperature of 245°C \pm 5°C with a dwell between 1.5 sec. to 3.0 sec. Exposure to the wave should not exceed temperatures above 260°C for five seconds at 0.063" below the seating plane. The packages should not be immersed in the wave.

Post Solder Cleaning Procedures

The least offensive cleaning solution is hot D.I. water (60°C) for less than 15 minutes. Addition of mild saponifiers is acceptable. Do not use commercial dishwasher detergents.

For faster cleaning, solvents may be used. Exercise care in choosing solvents as some may chemically attack the nylon package. Maximum exposure should not exceed two minutes at elevated temperatures. Acceptable solvents are TF (trichlorotrifluoroethane), TA, 111 Trichloroethane, and unheated acetone.⁽¹⁾

Note: 1. Acceptable commercial solvents are: Basic TF, Arklone, P. Genesolv, D. Genesolv DA, Blaco-Tron TF, Blaco-Tron TA, and Freon TA.

Unacceptable solvents contain alcohol, methanol, methylene chloride, ethanol, TP35, TCM, TMC, TMS+, TE, or TES. Since many commercial mixtures exist, contact a solvent vendor for chemical composition information. Some major solvent manufacturers are: Allied Chemical Corporation, Specialty Chemical Division, Morristown, NJ; Baron-Blakeslee, Chicago, IL; Dow Chemical, Midland, MI; E.I. DuPont de Nemours & Co., Wilmington, DE.

For further information refer to Appnotes 18 and 19 in the current Siemens Optoelectronic Data Book.

An alternative to soldering and cleaning the display modules is to use sockets. Naturally, 28 pin DIP sockets .600" wide with .100" centers work well for single displays.

Multiple display assemblies are best handled by longer SIP sockets or DIP sockets when available for uniform package alignment. Socket manufacturers are Aries Electronics, Inc., Frenchtown, NJ; Garry Manufacturing, New Brunswick, NJ; Robinson-Nugent, New Albany, IN; and Samtec Electronic Hardware, New Albany, IN.

For further information refer to Appnote 22 in the current Siemens Optoelectronic Data Book.

Optical Considerations

The .200" high character of the PDSP211X gives readability up to eight feet. Proper filter selection enhances readability over this distance.

Using filters emphasizes the contrast ratio between a lit LED and the character background. This will increase the discrimination of different characters. The only limitation is cost. Take into consideration the ambient lighting environment for the best cost/benefit ratio for filters.

Incandescent (with almost no green) or fluorescent (with almost no red) lights do not have the flat spectral response of sunlight. Plastic band-pass filters are an inexpensive and effective way to strengthen contrast ratios. The PDSP2110/2112 are red/high efficiency red displays and should be matched with long wavelength pass filter in the 570 nm to 590 nm range. The PDSP2111/2113/2114 should be matched with a yellow-green band-pass filter that peaks at 565 nm. For displays of multiple colors, neutral density grey filters offer the best compromise.

Additional contrast enhancement is gained by shading the displays. Plastic band-pass filters with built-in louvers offer the next step up in contrast improvement. Plastic filters can be improved further with anti-reflective coatings to reduce glare. The trade-off is fuzzy characters. Mounting the filters close to the display reduces this effect. Take care not to overheat the plastic filter by allowing for proper air flow.

Optimal filter enhancements are gained by using circular polarized, anti-reflective, band-pass filters. The circular polarizing further enhances contrast by reducing the light that travels through the filter and reflects back off the display to less than 1%. Selecting the proper intensity of the displays allows 10,000 foot candle sunlight viewability.

Several filter manufacturers supply quality filter materials. Some of them are: Panelgraphic Corporation, W. Caldwell, NJ; SGL Homalite, Wilmington, DE; 3M Company, Visual Products Division, St. Paul, MN; Polaroid Corporation, Polarizer Division, Cambridge, MA; Marks Polarized Corporation, Deer Park, NY; Hoya Optics, Inc., Fremont, CA.

One last note on mounting filters: recessing displays and bezel assemblies is an inexpensive way to provide a shading effect in overhead lighting situations. Several bezel manufacturers are: R.M.F. Products, Batavia, IL; Nobex Components, Griffith Plastic Corp., Burlingame, CA; Photo Chemical Products of California, Santa Monica, CA; I.E.E.-Atlas, Van Nuys, CA.
