

RT9161/A

300/500mA Low Dropout Linear Voltage Regulator

General Description

The RT9161/A is a 300/500mA fixed output voltage low dropout linear regulator. Typical ground current is approximately 110 μ A, from zero to maximum loading conditions. Wide range of available output voltage fits most of applications. Built-in output current-limiting and thermal-limiting provide maximal protection against any fault conditions.

For ease of application, the RT9161/A comes in the popular 3-pin SOT-23 (300mA), SOT-89 (300mA), SOT-223 (500mA), or TO-92 packages.

Ordering Information

RT9161/A-	□	□	□	□	□		
	Package Type	V : SOT-23-3	X : SOT-89	G : SOT-223	ZL : TO-92 (L-Type)		
					ZT : TO-92 (T-Type)		
	Operating Temperature Range	C : Commercial Standard	P : Pb Free with Commercial Standard				
	Output Voltage						
	15 : 1.5V						
	16 : 1.6V						
	:						
	49 : 4.9V						
	50 : 5.0V						
	500mA Output Current						
	300mA Output Current						

Note :

RichTek Pb-free products are :

- RoHS compliant and compatible with the current requirements of IPC/JEDEC J-STD-020.
- Suitable for use in SnPb or Pb-free soldering processes.
- 100%matte tin (Sn) plating.

Features

- Low Dropout Voltage of 200mV at Output Current 100mA, 450mV at Output Current 300mA, and 750mV at 500mA Output Current
- Guaranteed 300/500mA Output Current
- Internal 1.5 Ω P-MOSFET Draws No Base Current
- Low Ground Current 110 μ A
- 2% Accuracy Output Voltage
- Input Voltage Range up to 12V
- Extremely Tight Load Regulation
- Fast Transient Response
- Current-limiting and Thermal-limiting
- RoHS Compliant and 100% Lead (Pb)-Free

Applications

- Voltage Regulator for LAN Card, CD-ROM, and DVD
- Wireless Communication Systems
- Battery Powered Systems

Marking Information

For marking information, contact our sales representative directly or through a RichTek distributor located in your area, otherwise visit our website for detail.

Typical Application Circuit

Functional Pin Description

Pin Name	Pin Function
VOUT	Output Voltage
GND	Ground
VIN	Power Input

Function Block Diagram

Absolute Maximum Ratings

• Input Voltage -----	-0.3 to 14V
• Operating Junction Temperature Range -----	-40°C to 125°C
• Storage Temperature Range -----	-65°C to 150°C
• Power Dissipation, P_D @ $T_A = 25^\circ C$	
SOT-23-3 -----	0.4W
SOT-89 -----	0.571W
SOT-223 -----	0.741W
TO-92 -----	0.625W
• Package Thermal Resistance (Note 4)	
SOT-23-3, θ_{JA} -----	250°C/W
SOT-23-3, θ_{JC} -----	140°C/W
SOT-89, θ_{JA} -----	175°C/W
SOT-89, θ_{JC} -----	100°C/W
SOT-223, θ_{JA} -----	135°C/W
SOT-223, θ_{JC} -----	15°C/W
TO-92, θ_{JA} -----	160°C/W
TO-92, θ_{JC} -----	125°C/W

Electrical Characteristics

($T_A = 25^\circ C$, $C_{IN} = 1\mu F$, $C_{OUT} = 10\mu F$, unless otherwise specified.)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Output Voltage Accuracy	ΔV_{OUT}	$I_L = 1mA$, $V_{IN} = 5V$	-2	--	+2	%
Output Voltage Temperature Coefficient			--	50	150	PPM/°C
Line Regulation	ΔV_{LINE}	$I_L = 1mA$, $V_{IN} = 4.5 \sim 12V$	--	2	3	% V_{OUT}
Load Regulation (Note 1)	ΔV_{LOAD}	$I_L = 1mA \sim 300/500mA$, $V_{IN} = 5V$	--	1	30/50	mV
Current Limit (Note 2)	RT9161	$V_{IN} = 5V$, $V_{OUT} = 0V$	350	580	--	mA
	RT9161A		500	900	--	
Dropout Voltage (Note 3)	V_{DROP}	$I_L = 300/500mA$	--	450/750	600/1000	mV
Standby Current	$I_{STANDBY}$	$I_L = 0$, $V_{IN} = 12V$	--	110	180	μA

Note 1. Regulation is measured at constant junction temperature, using pulsed ON time.

Note 2. Current Limit is measured at constant junction temperature, using pulsed ON time.

Note 3. The dropout voltage is defined as $V_{IN} - V_{OUT}$, which is measured when V_{OUT} is $V_{OUT(NORMAL)} - 100mV$.

Note 4. θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a low effective single layer thermal conductivity test board of JEDEC 51-3 thermal measurement standard.

Application Information

A 10uF capacitor with 200mΩ or higher ESR, connecting between VOUT and GND pins, is recommended for stability. A capacitor with ESR smaller than 200 mΩ may cause VOUT oscillation as shown in Figure 1. Operating temperature should be well considered to ensure that the capacitance is no less than 10uF over the operating temperature range. Please take the notice that Aluminum electrolytic capacitors may cause VOUT oscillation when operating below -25°C. The capacitance can be increased without limit for better transient response.

A 1uF or higher capacitor should be placed between VIN and GND to filter out input noise and ensure stable output voltage.

Figure 1

Thermal protection limits power dissipation in RT9161/A. When the operation junction temperature exceeds 165°C, the OTP circuit starts the thermal shutdown function and turns the pass element off. The pass element turn on again after the junction temperature cools by 30°C.

For continuous operation, do not exceed absolute maximum operation junction temperature 125°C. The power dissipation definition in device is:

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_Q$$

The maximum power dissipation depends on the thermal resistance of IC package, PCB layout, the rate of surroundings airflow and temperature difference between junction to ambient. The maximum power dissipation can be calculated by following formula:

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

Where $T_{J(MAX)}$ is the maximum operation junction temperature 125°C, T_A is the ambient temperature and the θ_{JA} is the junction to ambient thermal resistance.

For recommended operating conditions specification of RT9161/A, where $T_{J(MAX)}$ is the maximum junction temperature of the die (125°C) and T_A is the maximum ambient temperature. The junction to ambient thermal resistance θ_{JA} is layout dependent. For SOT-223 packages, the thermal resistance θ_{JA} is 135°C/W on the standard JEDEC 51-3 single-layer 1S thermal test board. The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated by following formula:

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 250 = 0.400 \text{ W for SOT-23-3 packages}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 175 = 0.571 \text{ W for SOT-89 packages}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 135 = 0.741 \text{ W for SOT-223 packages}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / 160 = 0.625 \text{ W for TO-92 packages}$$

The maximum power dissipation depends on operating ambient temperature for fixed $T_{J(MAX)}$ and thermal resistance θ_{JA} . For RT9161/A packages, the Figure 2 of derating curves allows the designer to see the effect of rising ambient temperature on the maximum power allowed.

Figure 2. Derating Curves
