

LT1124/LT1125

## Dual/Quad Low Noise, High Speed Precision Op Amps

### FEATURES

- 100% Tested Low Voltage Noise:  $2.7\text{nV}/\sqrt{\text{Hz}}$  Typ  
 $4.2\text{nV}/\sqrt{\text{Hz}}$  Max
- Slew Rate:  $4.5\text{V}/\mu\text{s}$  Typ
- Gain Bandwidth Product:  $12.5\text{MHz}$  Typ
- Offset Voltage, Prime Grade:  $70\mu\text{V}$  Max  
Low Grade:  $100\mu\text{V}$  Max
- High Voltage Gain: 5 Million Min
- Supply Current Per Amplifier:  $2.75\text{mA}$  Max
- Common Mode Rejection:  $112\text{dB}$  Min
- Power Supply Rejection:  $116\text{dB}$  Min
- Available in 8-Pin SO Package

### APPLICATIONS

- Two and Three Op Amp Instrumentation Amplifiers
- Low Noise Signal Processing
- Active Filters
- Microvolt Accuracy Threshold Detection
- Strain Gauge Amplifiers
- Direct Coupled Audio Gain Stages
- Tape Head Preamplifiers
- Infrared Detectors

### DESCRIPTION

The LT®1124 dual and LT1125 quad are high performance op amps that offer higher gain, slew rate and bandwidth than the industry standard OP-27 and competing OP-270/OP-470 op amps. In addition, the LT1124/LT1125 have lower  $I_B$  and  $I_{OS}$  than the OP-27; lower  $V_{OS}$  and noise than the OP-270/OP-470.

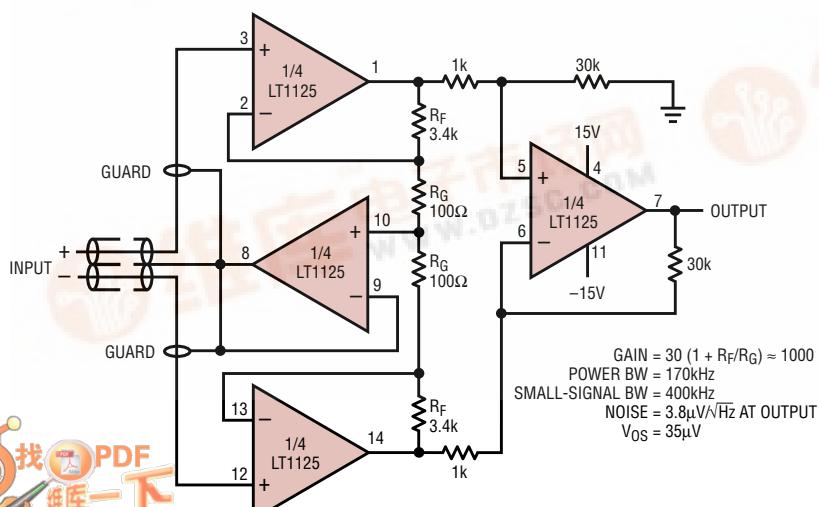

In the design, processing and testing of the device, particular attention has been paid to the optimization of the entire distribution of several key parameters. Slew rate, gain bandwidth and 1kHz noise are 100% tested for each individual amplifier. Consequently, the specifications of even the lowest cost grades (the LT1124C and the LT1125C) have been spectacularly improved compared to equivalent grades of competing amplifiers.

Power consumption of the LT1124 is one half of two OP-27s. Low power and high performance in an 8-pin SO package make the LT1124 a first choice for surface mounted systems and where board space is restricted.

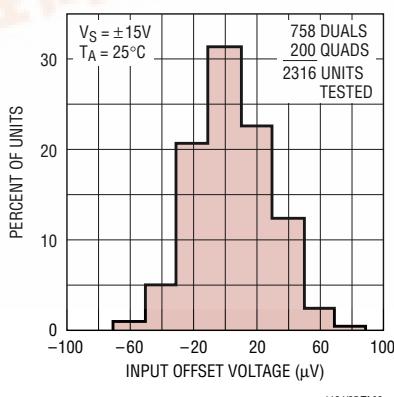

For a decompensated version of these devices, with three times higher slew rate and bandwidth, please see the LT1126/LT1127 data sheet.

### TYPICAL APPLICATION

Instrumentation Amplifier with Shield Driver

Input Offset Voltage Distribution  
(All Packages, LT1124 and LT1125)

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Typical parameters are defined as the 60% yield of parameter distributions of individual amplifiers; i.e., out of 100 LT1125s (or 100 LT1124s) typically 240 op amps (or 120) will be better than the indicated specification.

**Note 3:** This parameter is 100% tested for each individual amplifier.

**Note 4:** This parameter is sample tested only.

**Note 5:** This parameter is not 100% tested.

**Note 6:** The inputs are protected by back-to-back diodes. Current limiting resistors are not used in order to achieve low noise. If differential input voltage exceeds  $\pm 1.4\text{V}$ , the input current should be limited to 25mA.

**Note 7:** Slew rate is measured in  $A_V = -1$ ; input signal is  $\pm 7.5\text{V}$ , output measured at  $\pm 2.5\text{V}$ .

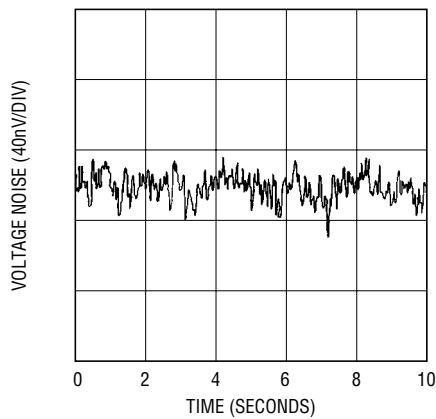

**Note 8:** 0.1Hz to 10Hz noise can be inferred from the 10Hz noise voltage density test. See the test circuit and frequency response curve for 0.1Hz to 10Hz tester in the Applications Information section of the LT1007 or LT1028 data sheets.

**Note 9:** This parameter is guaranteed but not tested.

**Note 10:** The LT1124C/LT1125C and LT1124AC/LT1125AC are guaranteed to meet specified performance from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$  and are designed, characterized and expected to meet these extended temperature limits, but are not tested at  $-40^{\circ}\text{C}$  and  $85^{\circ}\text{C}$ . The LT1124AI and LT1124I are guaranteed to meet the extended temperature limits.

## APPLICATIONS INFORMATION

The LT1124 may be inserted directly into OP-270 sockets. The LT1125 plugs into OP-470 sockets. Of course, all standard dual and quad bipolar op amps can also be replaced by these devices.

### Matching Specifications

In many applications the performance of a system depends on the matching between two op amps, rather than the individual characteristics of the two devices. The three op amp instrumentation amplifier configuration shown in this data sheet is an example. Matching characteristics are not 100% tested on the LT1124/LT1125.

Some specifications are guaranteed by definition. For example, 70 $\mu$ V maximum offset voltage implies that mismatch cannot be more than 140 $\mu$ V. 112dB (= 2.5 $\mu$ V/V) CMRR means that worst case CMRR match is 106dB.

(5 $\mu$ V/V). However, Table 1 can be used to estimate the expected matching performance between the two sides of the LT1124, and between amplifiers A and D, and between amplifiers B and C of the LT1125.

### Offset Voltage and Drift

Thermocouple effects, caused by temperature gradients across dissimilar metals at the contacts to the input terminals, can exceed the inherent drift of the amplifier unless proper care is exercised. Air currents should be minimized, package leads should be short, the two input leads should be close together and maintained at the same temperature.

The circuit shown in Figure 1 to measure offset voltage is also used as the burn-in configuration for the LT1124/LT1125, with the supply voltages increased to  $\pm 16$ V.

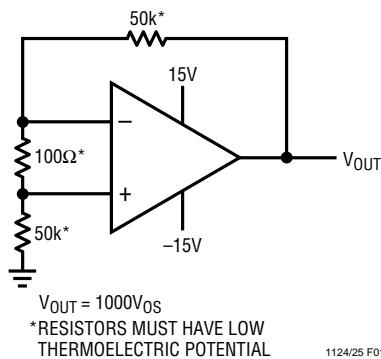

Figure 1. Test Circuit for Offset Voltage and Offset Voltage Drift with Temperature

## APPLICATIONS INFORMATION

### High Speed Operation

When the feedback around the op amp is resistive ( $R_F$ ), a pole will be created with  $R_F$ , the source resistance and capacitance ( $R_S, C_S$ ), and the amplifier input capacitance ( $C_{IN} \approx 2\text{pF}$ ). In low closed loop gain configurations and with  $R_S$  and  $R_F$  in the kilohm range, this pole can create excess phase shift and even oscillation. A small capacitor ( $C_F$ ) in parallel with  $R_F$  eliminates this problem (see Figure 2). With  $R_S (C_S + C_{IN}) = R_F C_F$ , the effect of the feedback pole is completely removed.

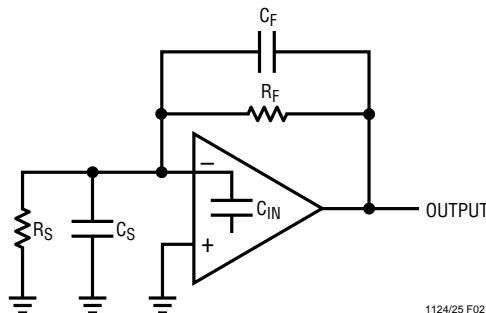

Figure 2. High Speed Operation

### Unity Gain Buffer Applications

When  $R_F \leq 100\Omega$  and the input is driven with a fast, large signal pulse (>1V), the output waveform will look as shown in Figure 3.

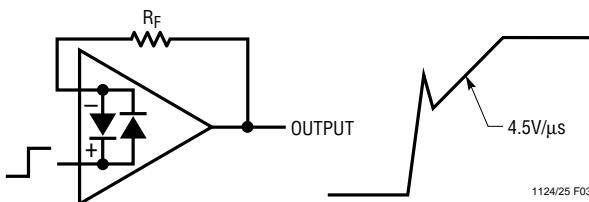

Figure 3. Unity-Gain Buffer Applications

During the fast feedthrough-like portion of the output, the input protection diodes effectively short the output to the input and a current, limited only by the output short circuit protection, will be drawn by the signal generator. With  $R_F \geq 500\Omega$ , the output is capable of handling the current requirements ( $I_L \leq 20\text{mA}$  at 10V) and the amplifier stays in its active mode and a smooth transition will occur.

### Noise Testing

Each individual amplifier is tested to  $4.2\text{nV}/\sqrt{\text{Hz}}$  voltage noise; i.e., for the LT1124 two tests, for the LT1125 four tests are performed. Noise testing for competing multiple op amps, if done at all, may be sample tested or tested using the circuit shown in Figure 4.

$$e_{n OUT} = \sqrt{(e_{nA})^2 + (e_{nB})^2 + (e_{nC})^2 + (e_{nD})^2}$$

If the LT1125 were tested this way, the noise limit would be  $\sqrt{4 \cdot (4.2\text{nV}/\sqrt{\text{Hz}})^2} = 8.4\text{nV}/\sqrt{\text{Hz}}$ . But is this an effective screen? What if three of the four amplifiers are at a typical  $2.7\text{nV}/\sqrt{\text{Hz}}$ , and the fourth one was contaminated and has  $6.9\text{nV}/\sqrt{\text{Hz}}$  noise?

$$\text{RMS Sum} = \sqrt{(2.7)^2 + (2.7)^2 + (2.7)^2 + (6.9)^2} = 8.33\text{nV}/\sqrt{\text{Hz}}$$

This passes an  $8.4\text{nV}/\sqrt{\text{Hz}}$  spec, yet one of the amplifiers is 64% over the LT1125 spec limit. Clearly, for proper noise measurement, the op amps have to be tested individually.

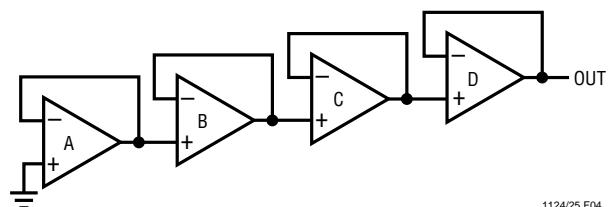

Figure 4. Competing Quad Op Amp Noise Test Method

# LT1124/LT1125

## PERFORMANCE COMPARISON

Table 2 summarizes the performance of the LT1124/LT1125 compared to the low cost grades of alternate approaches.

The comparison shows how the specs of the LT1124/LT1125 not only stand up to the industry standard OP-27,

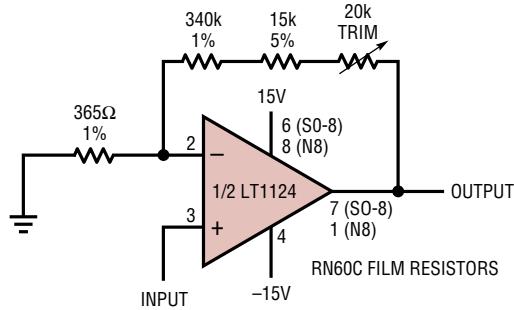

but in most cases are superior. Normally dual and quad performance is degraded when compared to singles, for the LT1124/LT1125 this is not the case.

**Table 2. Guaranteed Performance,  $V_S = \pm 15V$ ,  $T_A = 25^\circ C$ , Low Cost Devices**

## TYPICAL APPLICATIONS

**Gain 1000 Amplifier with 0.01% Accuracy, DC to 1Hz**

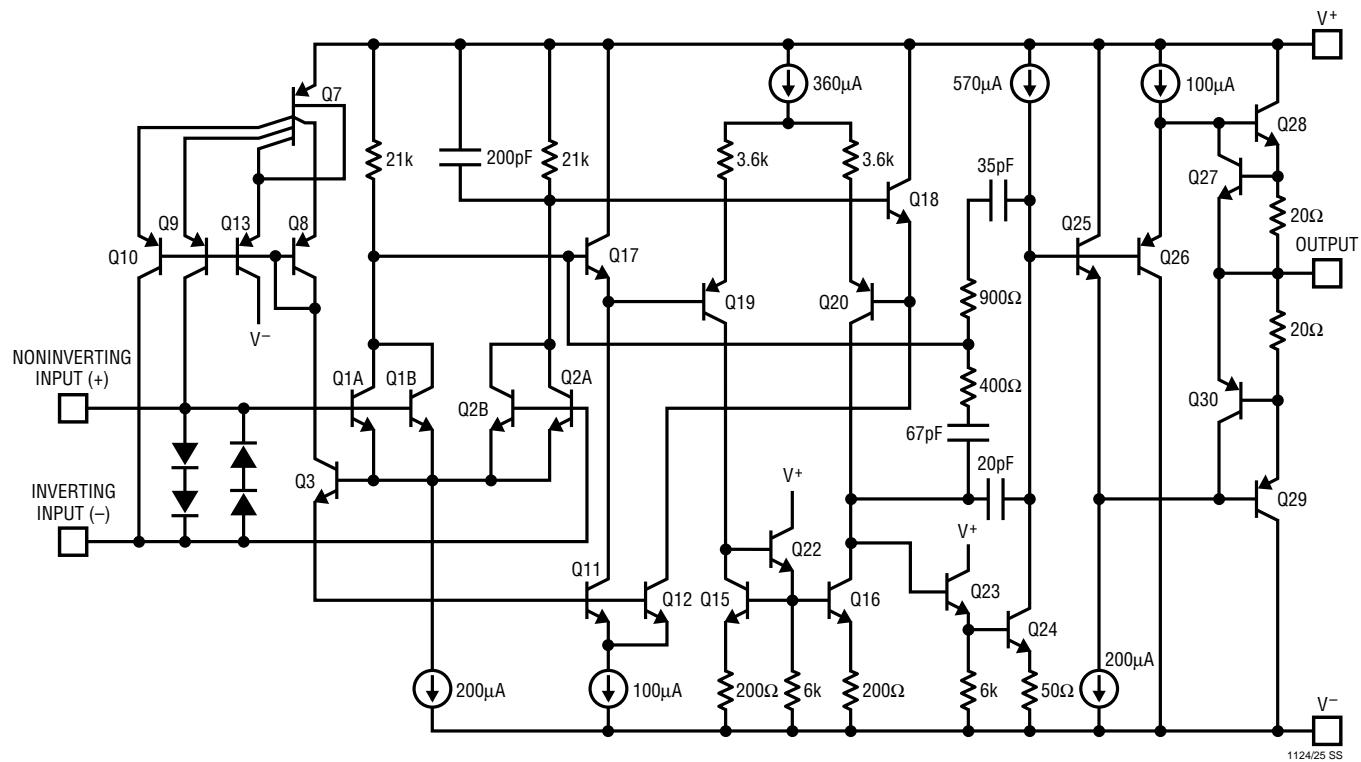

THE HIGH GAIN AND WIDE BANDWIDTH OF THE LT1124/LT1125, IS USEFUL IN LOW FREQUENCY HIGH CLOSED-LOOP GAIN AMPLIFIER APPLICATIONS. A TYPICAL PRECISION OP AMP MAY HAVE AN OPEN-LOOP GAIN OF ONE MILLION WITH 500kHz BANDWIDTH. AS THE GAIN ERROR PLOT SHOWS, THIS DEVICE IS CAPABLE OF 0.1% AMPLIFYING ACCURACY UP TO 0.3Hz ONLY. EVEN INSTRUMENTATION RANGE SIGNALS CAN VARY AT A FASTER RATE. THE LT1124/LT1125 "GAIN PRECISION — BANDWIDTH PRODUCT" IS 75 TIMES HIGHER, AS SHOWN.

**Gain Error vs Frequency Closed-Loop Gain = 1000**

# LT1124/LT1125

## PACKAGE DESCRIPTION Dimensions in inches (millimeters) unless otherwise noted.

### J8 Package 8-Lead CERDIP (Narrow 0.300, Hermetic) (LTC DWG # 05-08-1110)

### N8 Package 8-Lead PDIP (Narrow 0.300) (LTC DWG # 05-08-1510)

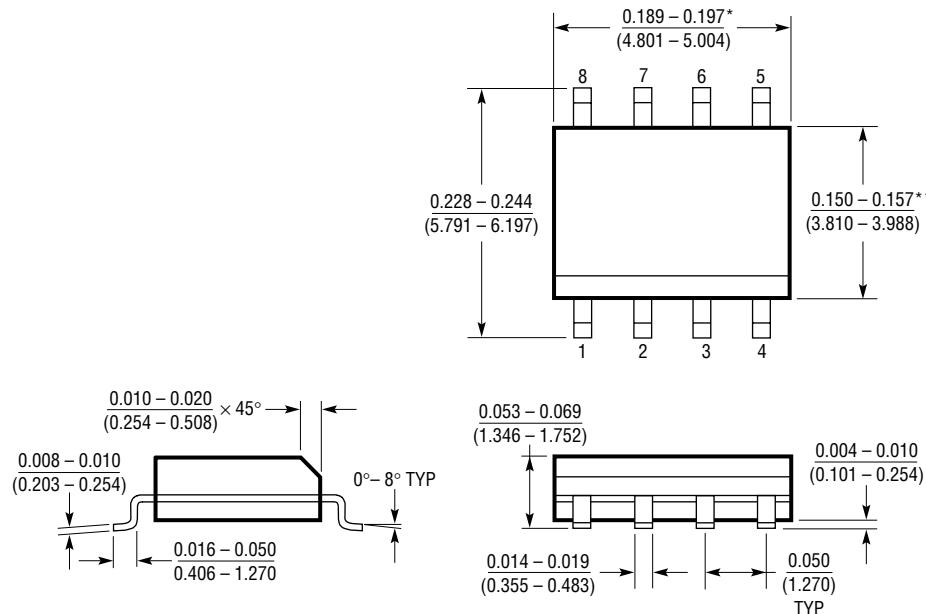

\*THESE DIMENSIONS DO NOT INCLUDE MOLD FLASH OR PROTRUSIONS.  
MOLD FLASH OR PROTRUSIONS SHALL NOT EXCEED 0.010 INCH (0.254mm)

**PACKAGE DESCRIPTION**

Dimensions in inches (millimeters) unless otherwise noted.

**S8 Package**  
**8-Lead Plastic Small Outline (Narrow 0.150)**  
(LTC DWG # 05-08-1610)

\*DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH  
SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

\*\*DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD  
FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

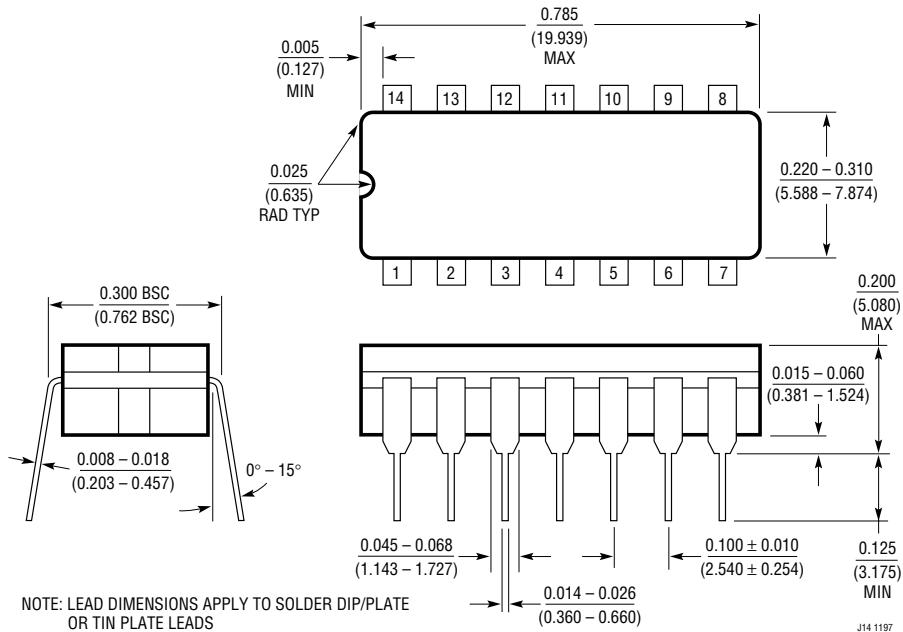

S08 0996

# LT1124/LT1125

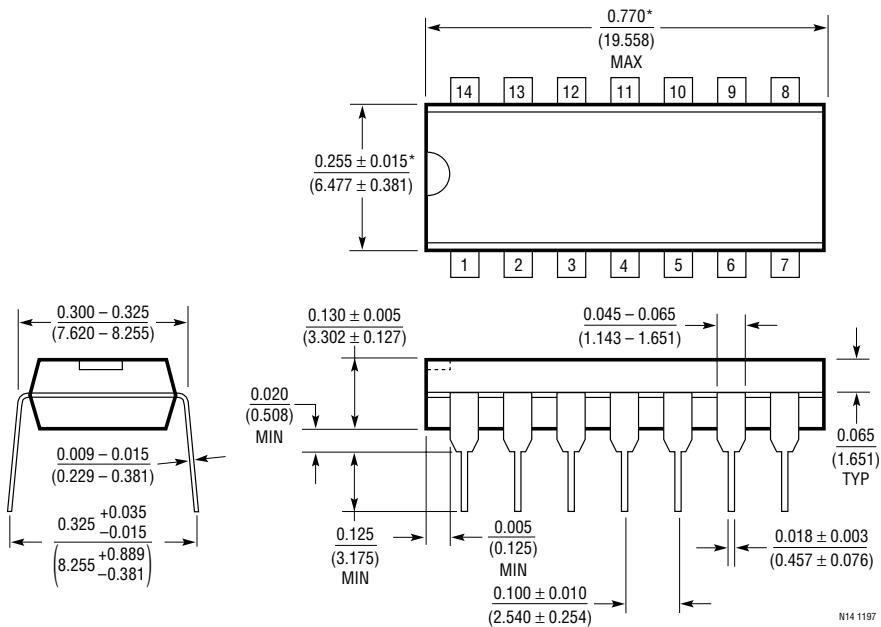

## PACKAGE DESCRIPTION

Dimensions in inches (millimeters) unless otherwise noted.

**J Package**  
**14-Lead CERDIP (Narrow 0.300, Hermetic)**  
(LTC DWG # 05-08-1110)

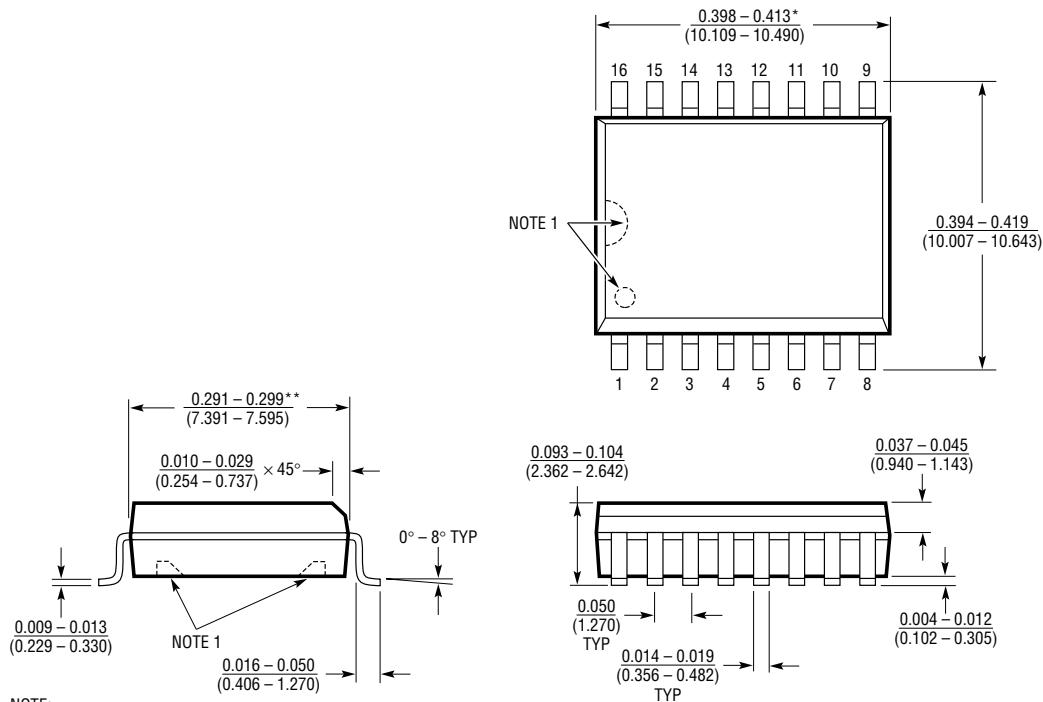

**N Package**  
**14-Lead PDIP (Narrow 0.300)**  
(LTC DWG # 05-08-1510)

**PACKAGE DESCRIPTION**

Dimensions in inches (millimeters) unless otherwise noted.

**SW Package**  
**16-Lead Plastic Small Outline (Wide 0.300)**  
(LTC DWG # 05-08-1620)

## NOTE:

- PIN 1 IDENT, NOTCH ON TOP AND CAVITIES ON THE BOTTOM OF PACKAGES ARE THE MANUFACTURING OPTIONS.  
THE PART MAY BE SUPPLIED WITH OR WITHOUT ANY OF THE OPTIONS

S16 (WIDE) 0396

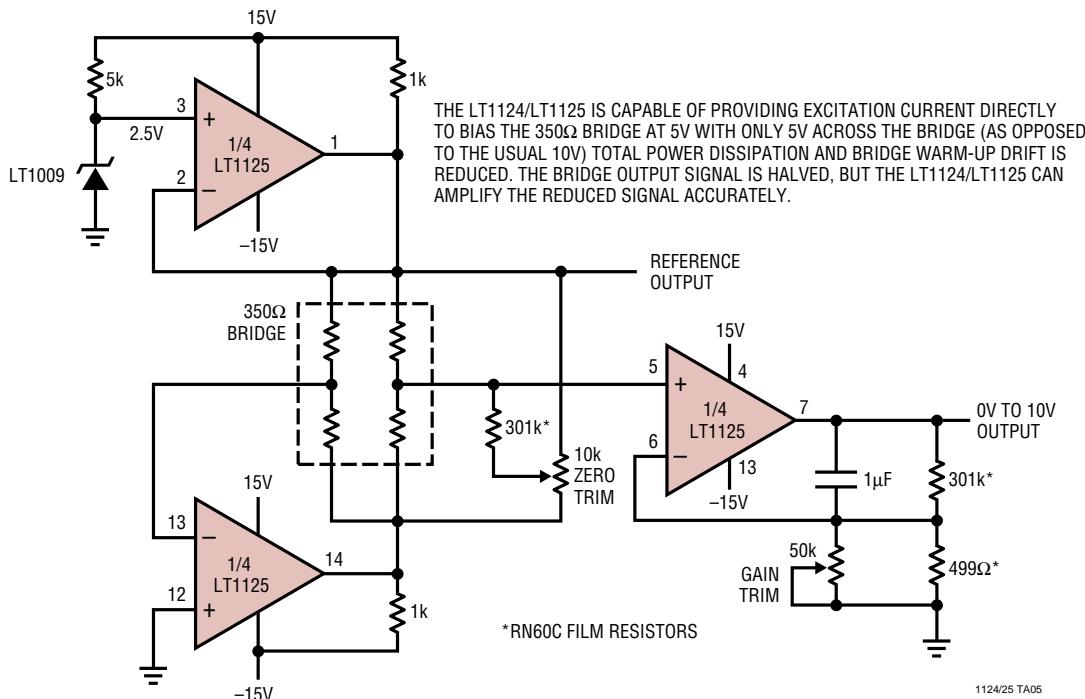

\*DIMENSION DOES NOT INCLUDE MOLD FLASH. MOLD FLASH SHALL NOT EXCEED 0.006" (0.152mm) PER SIDE

\*\*DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD FLASH SHALL NOT EXCEED 0.010" (0.254mm) PER SIDE

# LT1124/LT1125

## TYPICAL APPLICATION

Strain Gauge Signal Conditioner with Bridge Excitation

## RELATED PARTS

PART NUMBER	DESCRIPTION	COMMENTS
LT1007	Single Low Noise, Precision Op Amp	$2.5\text{nV}/\sqrt{\text{Hz}}$ 1kHz Voltage Noise
LT1028/LT1128	Single Low Noise, Precision Op Amps	$0.85\text{nV}/\sqrt{\text{Hz}}$ Voltage Noise
LT1112/LT1114	Dual/Quad Precision Picoamp Input	$250\text{pA}$ Max $I_B$
LT1113	Dual Low Noise JFET Op Amp	$4.5\text{nV}/\sqrt{\text{Hz}}$ Voltage Noise, $10\text{fA}/\sqrt{\text{Hz}}$ Current Noise
LT1126/LT1127	Decompensated LT1124/LT1125	$11\text{V}/\mu\text{s}$ Slew Rate
LT1169	Dual Low Noise JFET Op Amp	$6\text{nV}/\sqrt{\text{Hz}}$ Voltage Noise, $1\text{fA}/\sqrt{\text{Hz}}$ Current Noise, $10\text{pA}$ Max $I_B$
LT1792	Single LT1113	$4.2\text{nV}/\sqrt{\text{Hz}}$ Voltage Noise, $10\text{fA}/\sqrt{\text{Hz}}$ Current Noise
LT1793	Single LT1169	$6\text{nV}/\sqrt{\text{Hz}}$ Voltage Noise, $1\text{fA}/\sqrt{\text{Hz}}$ Current Noise, $10\text{pA}$ Max $I_B$
