DESCRIPTION

The 74AC/ACT11239 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT11239 has two independent decoders, each accepting two binary weighted inputs (nA_0, nA_1) and providing four mutually exclusive active-High outputs ($nY_0 - nY_3$). Each decoder has an active-Low Enable (nE). When E is High, every output is forced Low. The Enable can be used as the Data input for a 1-of-4 demultiplexer application.

NOTES:

- Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
