**DESCRIPTION**

The MAN3480A, MAN3680A, MAN78A, MAN3880A and MAN3980A are common cathode displays which provide a choice of color of LED displays. They are pin and functional replacements for the 0.300-inch Hewlett-Packard common cathode displays. The series is complementary to the MAN3400A, MAN3600A, MAN70A, MAN3800A and MAN3900A families of displays. They can be mounted in arrays with 0.400-inch (10.16 mm) center-to-center spacing. Yellow and High Efficiency Green displays are constructed with Grey face and neutral segment color. Red displays have Black faces and Red segment color. Others have face and segment color corresponding to the emitted light.

- | <b>NOTES</b>  |
|---|
| <ol style="list-style-type: none"> <li>1. The digit average Luminous Intensity is obtained by summing the Luminous Intensity of each segment and dividing by the total number of segments. Intensity will not vary more than <math>\pm 33.3\%</math> between all segments within a digit.</li> <li>2. The curve in Figures 3, 6, 9, and 12 is normalized to the brightness at 25°C to indicate the relative Luminous Intensity over the operating temperature range.</li> <li>3. The decimal point is designed to have the same surface brightness as the segments, therefore, the Luminous Intensity of the decimal point is .3 times the Luminous Intensity of the segments, since the area of the decimal point is .3 times the area of the average segment.</li> <li>4. Leads of the device immersed to 1/16 inch from the body. Maximum device surface temperature is 140°C.</li> <li>5. For flux removal, Freon TF, Freon TE, Isoproponal or water may be used up to their boiling points.</li> <li>6. All displays are categorized for Luminous Intensity. The Intensity category is marked on each part as a suffix letter to the part number.</li> </ol> |
