Functional Description^[1]

The CY62157DV30 is a high-performance CMOS static RAM organized as 512K words by 16 bits. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption. The device can also be put into standby mode when deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW or both BHE and BLE are HIGH). The input/output pins (I/O₀ through I/O₁₅) are placed in a high-impedance state when deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW), outputs are disabled (OE HIGH), both Byte High Enable and Byte Low Enable are disabled (BHE , BLE HIGH), or during a write operation (\overline{CE}_1 LOW, \overline{CE}_2 HIGH and WE LOW).

Writing to the device is accomplished by taking Chip Enables (\overline{CE}_1 LOW and \overline{CE}_2 HIGH) and Write Enable (WE) input LOW. If Byte Low Enable (BLE) is LOW, then data from I/O pins (I/O₀ through I/O₇) is written into the location specified on the address pins (A₀ through A₁₈). If Byte High Enable (BHE) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A₀ through A₁₈).

Reading from the device is accomplished by taking Chip Enables (\overline{CE}_1 LOW and \overline{CE}_2 HIGH) and Output Enable (OE) LOW while forcing the Write Enable (WE) HIGH. If Byte Low Enable (BLE) is LOW, then data from the memory location specified by the address pins will appear on I/O₀ to I/O₇. If Byte High Enable (BHE) is LOW, then data from memory will appear on I/O₈ to I/O₁₅. See the truth table for a complete description of read and write modes.

Notes:

2. Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC}(typ.), T_A = 25°C.
3. Automotive data is PRELIMINARY. Shaded areas of the datasheet contain PRELIMINARY information.
4. NC pins are not internally connected on the die.
5. DNU pins have to be left floating.
6. The BYTE pin in the 48-TSOP I package has to be tied HIGH to use the device as a 512K × 16 SRAM. The 48-TSOP I package can also be used as a 1M × 8 SRAM by tying the BYTE signal LOW. For 1M × 8 Functionality, please refer to the CY62158DV30 datasheet. In the 1M × 8 configuration, Pin 45 is A19.
7. The 44-TSOP II package device has only one chip enable pin (CE).

Notes:

15. BHE, \overline{BLE} is the AND of both BHE and \overline{BLE} . Chip can be deselected by either disabling the chip enable signals or by disabling both BHE and \overline{BLE} .
16. Test conditions for all parameters other than three-state parameters assume signal transition time of 3 ns or less, timing reference levels of $V_{CC(\text{typ})}/2$, input pulse levels of 0 to $V_{CC(\text{typ})}$, and output loading of the specified I_{OL}/I_{OH} as shown in the "AC Test Loads and Waveforms" section.
17. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
18. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
19. The internal Write time of the memory is defined by the overlap of WE, $\overline{CE}_1 = V_{IL}$, BHE and/or $\overline{BLE} = V_{IL}$, and $\overline{CE}_2 = V_{IH}$. All signals must be ACTIVE to initiate a write and any of these signals can terminate a write by going INACTIVE. The data input set-up and hold timing should be referenced to the edge of the signal that terminates the write.

Switching Waveforms

Read Cycle 1 (Address Transition Controlled)^[20, 21]

Read Cycle 2 (\overline{OE} Controlled)^[21, 22]

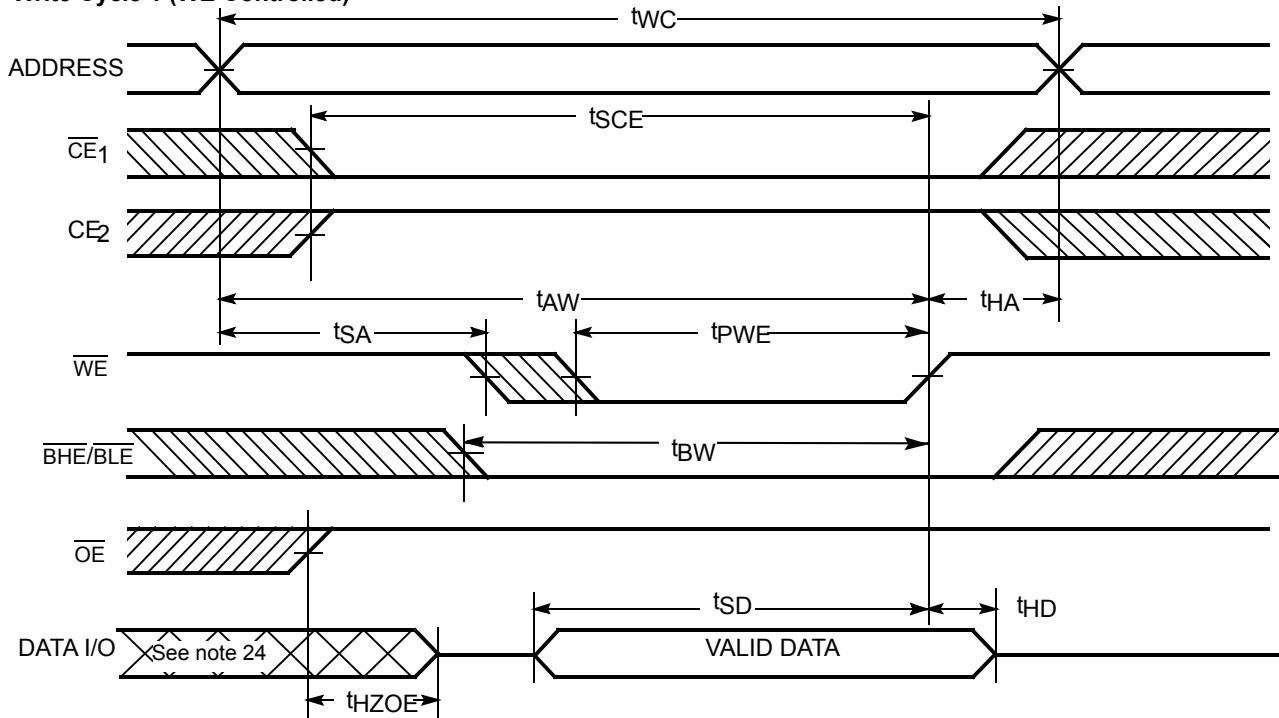

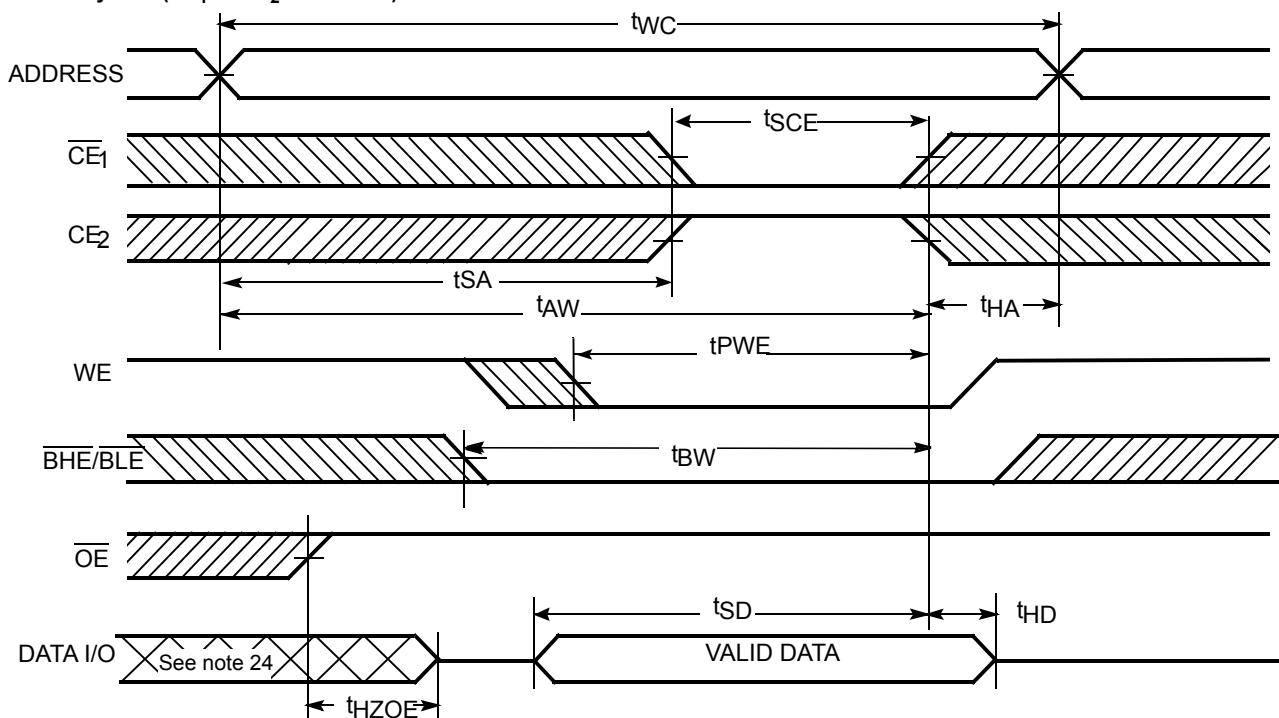

Notes:

20. The device is continuously selected. OE , $\overline{CE}_1 = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$, and $CE_2 = V_{IH}$.

21. \overline{WE} is HIGH for read cycle.

22. Address valid prior to or coincident with \overline{CE}_1 , \overline{BHE} , \overline{BLE} transition LOW and CE_2 transition HIGH.

Switching Waveforms (continued)

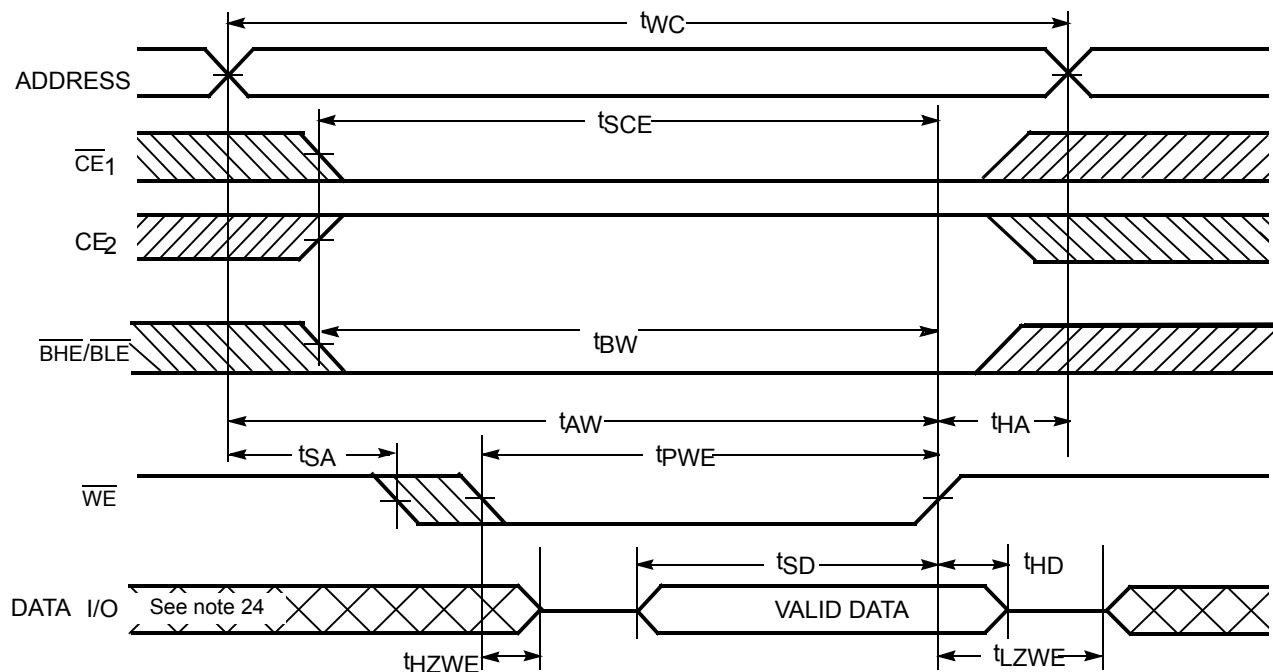

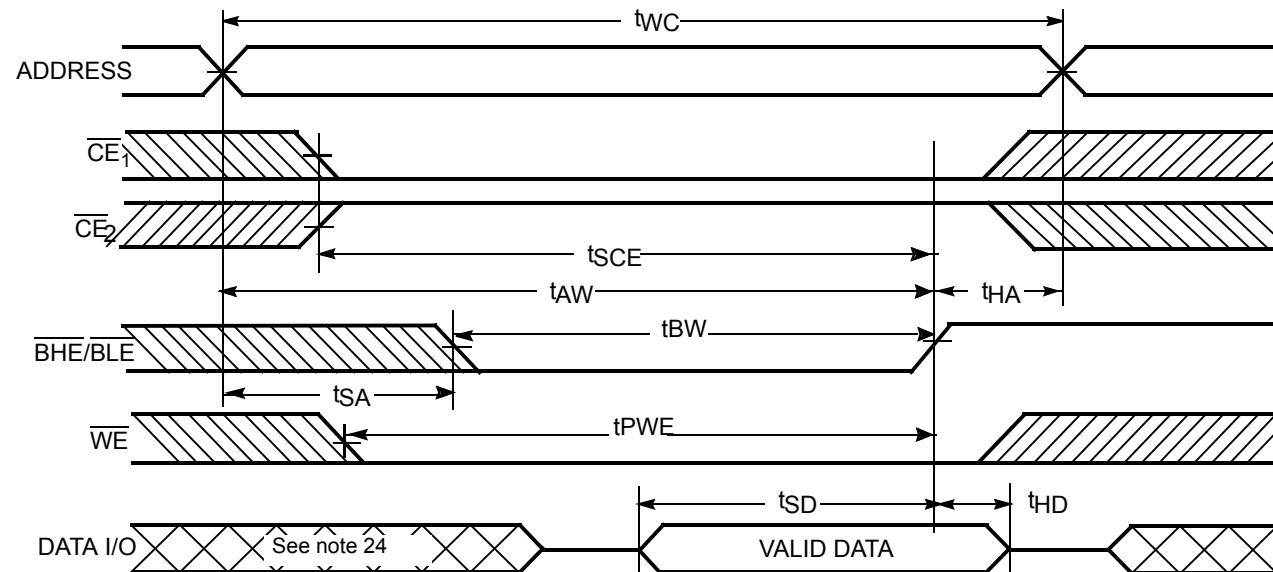

Write Cycle 1 (WE Controlled)^[19, 23, 24, 25]

Write Cycle 2 (\overline{CE}_1 or \overline{CE}_2 Controlled)^[19, 23, 24, 25]

Notes:

 23. Data I/O is high impedance if $\overline{OE} = V_{IH}$.

 24. If \overline{CE}_1 goes HIGH and \overline{CE}_2 goes LOW simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high-impedance state.

25. During this period, the I/Os are in output state and input signals should not be applied.

Write Cycle 4 (BHE/BLE Controlled, $\overline{\text{OE}}$ LOW)^[24, 25]
