- Single SO-16 Package

### DESCRIPTION

The Si9712 combines low on-resistance with slow ramp time and smart switching for overall best performance in integrated PC Card interface switches.

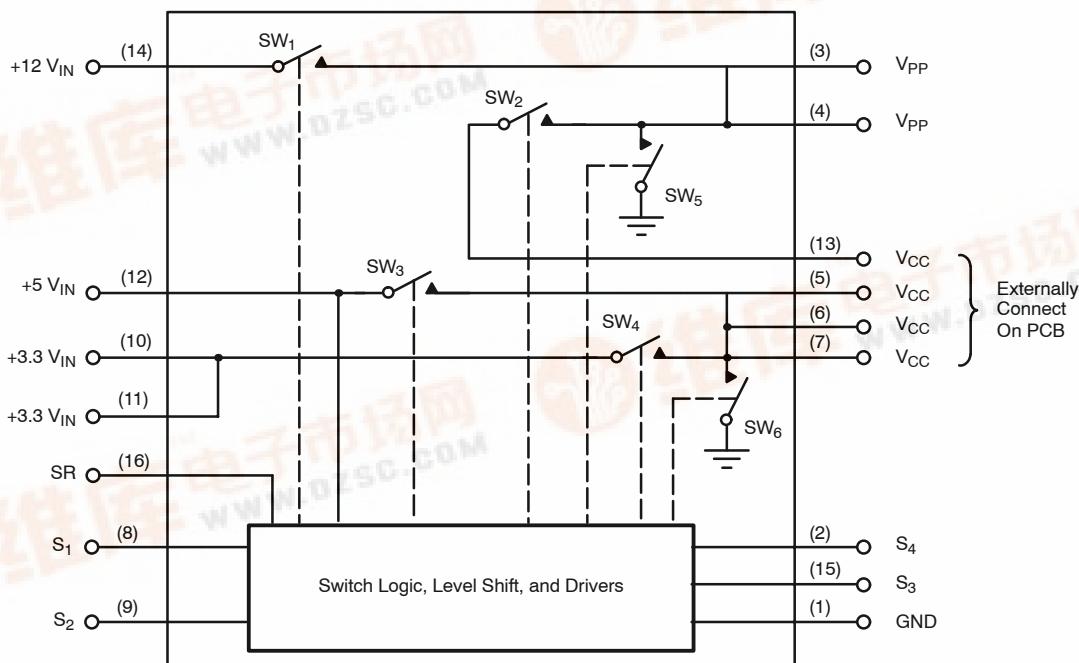

The Si9712 operates off the 5-V supply and has built-in level shifting for gate drive. Internal logic protects against an external control input error that would short 5 V to the 3.3-V supply. This protection logic also allows the Si9712 to be configured for positive or negative control logic for compatibility with a variety of PC Card controllers. These control inputs are CMOS logic compatible and can be driven to 3.3 V or 5 V.

The Si9712 complies with the release of the PC Card standard by supplying 0 V, 12 V, and V<sub>CC</sub> to the V<sub>PP</sub> output and 0 V, 3.3 V, and 5 V to the V<sub>CC</sub> output. The V<sub>CC</sub> ramp time is user programmable with an external capacitor connected to the SR pin.

The PC Card switch is packaged in a narrow body SO-16 package and is rated over the industrial temperature range -40 to 85°C.

The Si9712 is available in both standard and lead (Pb)-free packages.
