

**FEATURES**

- **CIC suitable package size**
- **8:1 compression ratio**
- **38 dB maximum system gain, adjustable over a 38 dB range**
- **output compression threshold, adjustable over 16 dB range**
- **designed to drive a class D integrated receiver**
- **averaging detector**

DESCRIPTION

The GS3026 CIC hybrid features AGC-O capability for low distortion output limiting and offers a package size suitable for CIC instruments. The circuit consists of a newly designed AGC preamplifier and output stage, capable of driving the class D integrated receiver. The compression control circuit varies the current controlled resistance, connected between the input and output of the AGC preamplifier. The compression circuit operates with an 8:1 compression ratio and uses an averaging detector with a time constant of 270 ms, selected to provide optimal sound quality over the full range of sound and listening environments. The actual attack and release times are typically 40 ms and 150 ms respectively when the circuit is fully in the compression region of operation (measured times will vary depending on gain and threshold settings).

The system gain and compression control can be adjusted by the choice of two independent resistors. Maximum system gain is 38 dB and it can be adjusted within a 38 dB range. The output compression threshold can be adjusted within a 16 dB range.

All resistors in ohms, all capacitors in farads unless otherwise stated.

Dimensioning units are inches.
Dimensions shown in parenthesis are in millimetres, converted from inches and include minor round off errors.
1.0000 inches = 25.400mm.
Dimension tolerances ± 0.003 ($+0.08$) unless otherwise stated.
Pad numbers and capacitor numbers for illustration only.
Smallest pad sizes 0.024×0.023 (0.61 x 0.58).
Largest pad size 0.020×0.040 (0.51 x 1.02).
XXXXXX - work order number.
This hybrid is designed for point to point manual soldering.
