

MK1704A Low EMI Clock Generator

Description

The MK1704A is an upgraded version of the MK1704 and is recommended for all new designs. It offers more reduction in the frequency amplitude peaks, and will support frequencies up to 140 MHz.

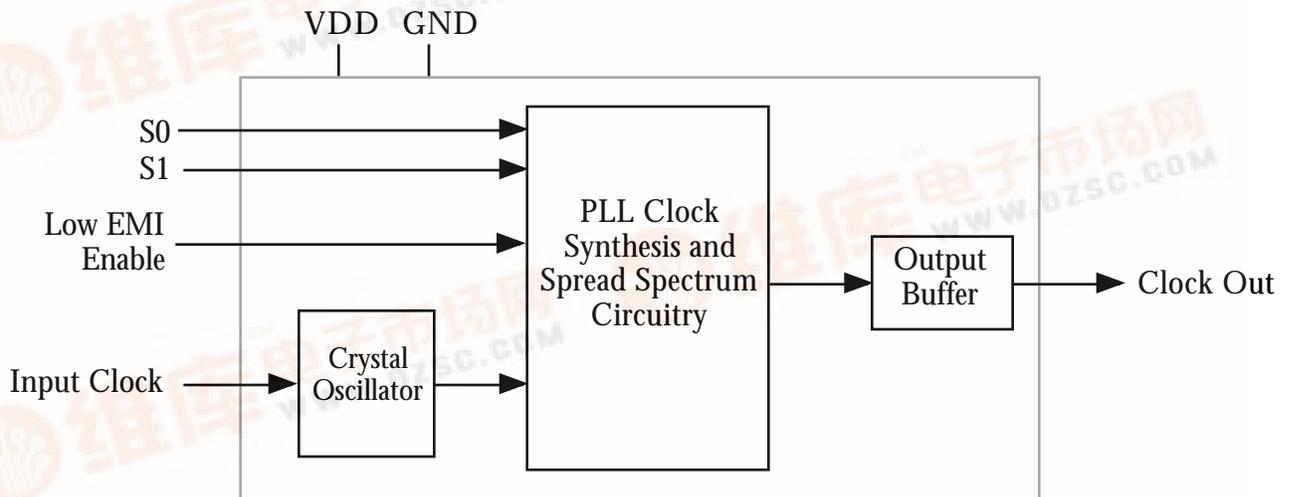

The MK1704A generates a low EMI output clock from a clock input. The part is designed to dither the LCD interface clock or other clocks for flat panel graphics controllers. The MK1704A uses ICS/MicroClock's proprietary mixture of analog and digital Phase-Locked Loop (PLL) technology to synthesize the frequency, and our patented technique to spread the frequency spectrum of the output, thereby reducing the frequency amplitude peaks by several dB.

We offer many other clocks for computers and computer peripherals. Consult us when you need to remove crystals and oscillators from your board.

Features

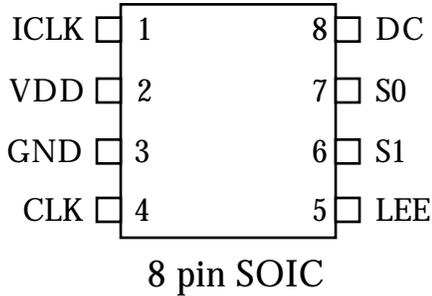

- Packaged in 8 pin SOIC 
- Provides a spread spectrum output clock
- Supports leading flat panel controllers
- Accepts a clock input, provides same frequency dithered output
- Optimized for higher resolutions that require up to 140 MHz, as well as 40 MHz (SVGA) and 65 MHz (XVGA) clocks
- Peak reduction by 7dB - 14 dB typical on 3rd-19th odd harmonics
- Low EMI feature can be disabled
- 3.3 V or 5 V $\pm 10\%$ supply voltage
- Advanced, low power CMOS process
- See the MK1714-01 for a multiplier with low EMI which can operate from a crystal

Pin Descriptions

Pin #	Name	Type	Description
1	ICLK	I	Connect to a clock input as shown in the table above.
2	VDD	P	Connect to +3.3V or +5V.
3	GND	P	Connect to ground.
4	CLK	O	Clock Output; equal to input frequency.
5	LEE	I	Low EMI Enable. Turns on the spread spectrum when high. Internal pull-up.
6	S1	I	Frequency Select 1 Input. Selects input/output clock range per table above. Internal pull-up.
7	S0	I	Frequency Select 0 Input. Selects input/output clock range per table above. Internal pull-up.
8	DC	-	Don't Connect. Do not connect anything to this pin.

Key: I = Input, O = output, P = power supply connection

External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01µF should be connected between VDD and GND on pins 2 and 3, and a 33 terminating resistor may be used on the clock output if the trace is longer than 1 inch. The MK1704A is designed for use with a clock input only. For a crystal input, use the MK1704S or the MK1714-01R.

Notes:

- Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
- Typical values are at 25°C.
- Not tested; guaranteed by design.
