

Description

The MK2771-16 is a low cost, low jitter, high performance VCXO and clock synthesizer designed for set-top boxes. The on-chip Voltage Controlled Crystal Oscillator accepts a 0 to 3V input voltage to cause the output clocks to vary by ±100 ppm. Using ICS/MicroClock's patented VCXO and analog Phase-Locked Loop (PLL) techniques, the device uses an inexpensive 13.5 MHz crystal input to produce multiple output clocks including a selectable processor clock, a selectable audio clock, two communications clocks, a 13.5 MHz clock, and three 27 MHz clocks. All clocks are frequency locked to the 27.00MHz output (and to each other) with zero ppm error, so any output can be used as the VCXO output.

Features

- Packaged in 28 pin SSOP (QSOP)
- On-chip patented VCXO with pull range of 200ppm (minimum)
- VCXO tuning voltage of 0 to 3V
- Processor frequency include 16.66, 20, 25, 32, 40, and 50 MHz
- Audio clocks support 32 kHz, 44.1 kHz, 48 kHz and 96 kHz sampling rates
- Zero ppm synthesis error in all clocks (all exactly track 27MHz VCXO)
- Uses an inexpensive 13.5 MHz crystal
- Full CMOS output swings with 25mA output drive capability at TTL levels
- Advanced, low power, sub-micron CMOS process
- 5V operating voltage with 3.3V capable I/O

Notes:

- 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
- 2. With all clocks at highest MHz.
- 3. With a pullable crystal that conforms to ICS' specifications:

 $\begin{array}{lll} \text{Correlation (load) capacitance} & 14 \text{ pF} \\ \text{C0/C1} & 240 \text{ maximum} \\ \text{ESR} & 25 \text{ maximum} \\ \text{Initial Accuracy} & \pm 20 \text{ ppm} \\ \text{Aging and Temp stability} & \pm 50 \text{ ppm} \\ \text{Operating Temperature} & 0 \text{ to } 70^{\circ}\text{C} \end{array}$

External Components

The MK2771-16 requires a minimum number of external components for proper operation. Use a low inductance ground plane, connect all GNDs to this. Connect $0.01\mu F$ decoupling caps on pins 5, 7, 8 and 22 directly to the ground plane, as close to the MK2771-16 as possible. A series termination resistor of 33 may be used for each clock output. The 13.500 MHz crystal must be connected as close to the chip as possible. The crystal should be a parallel mode, pullable, with load capacitance of 14pF. Consult ICS/MicroClock full specifications. Please obey Application Note MAN05 for pullable crystal layout info except for the following: the MK2771-16 introduces a GND pin (pin #3) between the pullable crystal pins. This ground should be brought in straight from the right side underneath the device.
