

MK3200 32.768 kHz Clock Oscillator

Description

The MK3200 is ICS' lowest cost, low power clock oscillator that generates a low power 32.768 kHz output from an inexpensive 32.768 kHz watch crystal. This part includes a power down pin and allows you to tri state the output clock for in-circuit testing.

ICS manufactures the largest variety of clock synthesizers for all applications. If more clock outputs are needed, including MHz frequencies, see the MK32xx family of parts. Consult ICS to eliminate VCXOs, crystals and oscillators from your board.

Features

- Packaged in 8 pin SOIC
- Operates from 2.5 V to 5 V
- Consumes only 3.5 μ A in normal operation
- Accepts an inexpensive 32.768 kHz crystal input
- Offers power down mode
- Includes an Output Enable pin to tri state the output for in-circuit testing
- Advanced, low power, sub-micron CMOS process
- For other 32.768 kHz-based clocks with MHz outputs, please consult ICS
- Industrial temperature version available

Notes: 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.

External Components

The MK3200 requires a minimum number of external components for proper operation. A decoupling capacitor of 0.01μF should be connected between VDD and GND on pins 2 and 3, as close to the MK3200 as possible. A series termination resistor of 33 Ω may be used for the clock output if the trace is longer than a few inches. The input crystal must be connected as close to the chip as possible. The input crystal should be a parallel mode watch crystal with 12 pF load capacitance.
