Description

The OPI1266 consists of a GaAlAs LED coupled with a unique integrated circuit detector. Photons are collected in the detector by a photodiode and amplified by a high gain linear amplifier that drives a Schottky clamped open collector output transistor. The circuit is temperature, current, and voltage compensated. This design produces maximum DC and AC current isolation between input and output while providing TTL/LSTTL circuit compatibility. Propagation delay times are matched within 500ns over the entire temperature range for timing purposes.⁽²⁾

Notes:

(1) RMA flux is recommended. Duration can be extended to 10 sec max. when flow soldering.

(2) $\Delta T_P = t_{PHL}-t_{PLH}$.

(3) Measured with input and output leads shorted. Typical input/output capacitance is 0.05 pF.

(4) UL recognition is for 5833 VAC, for 1 minute.
