FEATURE

- Adopting new 5th generation IGBT (CSTBT) chip, which performance is improved by 1 μ m fine rule process.
For example, typical $V_{ce(sat)}=1.5V$ @ $T_j=125^{\circ}C$
- I adopt the over-temperature conservation by T_j detection of CSTBT chip, and error output is possible from all each conservation upper and lower arm of IPM.
- New small package
Reduce the package size by 10%, thickness by 22% from S-DASH series.
 - 3 ϕ 150A, 600V Current-sense IGBT type inverter
 - Monolithic gate drive & protection logic
 - Detection, protection & status indication circuits for, short-circuit, over-temperature & under-voltage (P-Fo available from upper arm devices)
 - Acoustic noise-less 15kW/18.5kW class inverter application

APPLICATION

General purpose inverter, servo drives and other motor controls

PRECAUTIONS FOR TESTING

- Before applying any control supply voltage (V_{DIN}), the input terminals should be pulled up by resistors, etc. to their corresponding supply voltage and each input signal should be kept off state.
After this, the specified ON and OFF level setting for each input signal should be done.
- When performing "SC" tests, the turn-off surge voltage spike at the corresponding protection operation should not be allowed to rise above V_{CES} rating of the device.
(These test should not be done by using a curve tracer or its equivalent.)

NOTES FOR STABLE AND SAFE OPERATION ;

- Design the PCB pattern to minimize wiring length between opto-coupler and IPM's input terminal, and also to minimize the stray capacity between the input and output wirings of opto-coupler.
- Connect low impedance capacitor between the Vcc and GND terminal of each fast switching opto-coupler.
- Fast switching opto-couplers: $t_{PLH}, t_{PHL} \leq 0.8\mu s$, Use High CMR type.
- Slow switching opto-coupler: CTR > 100%
- Use 4 isolated control power supplies (Vd). Also, care should be taken to minimize the instantaneous voltage charge of the power supply.
- Make inductance of DC bus line as small as possible, and minimize surge voltage using snubber capacitor between P and N terminal.
- Use line noise filter capacitor (ex. 4.7nF) between each input AC line and ground to reject common-mode noise from AC line and improve noise immunity of the system.
