

1:4 CLOCK DISTRIBUTION

Precision Edge™
SY10EL15
SY100EL15
FINAL

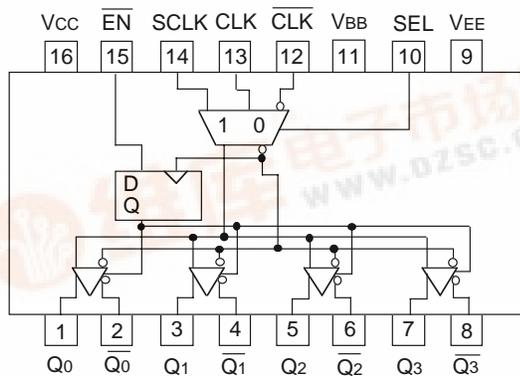

FEATURES

- 50ps output-to-output skew
- Synchronous enable/disable
- Multiplexed clock input
- 75KΩ internal input pull-down resistors
- Available in 16-pin SOIC package

DESCRIPTION

The SY10/100EL15 are low skew 1:4 clock distribution chips designed explicitly for low skew clock distribution applications. The device can be driven by either a differential or single-ended ECL or, if positive power supplies are used, PECL input signal. If a single-ended input is to be used the VBB output should be connected to the $\overline{\text{CLK}}$ input and bypassed to VCC via a 0.01μF capacitor. The VBB output is designed to act as the switching reference for the input of the EL15 under single-ended input conditions, as a result this pin can only source/sink up to 0.5mA of current.

The EL15 features a multiplexed clock input to allow for the distribution of a lower speed scan or test clock along with the high speed system clock. When LOW (or left open and pulled LOW by the input pull-down resistor) the SEL pin will select the differential clock input.

The common enable ($\overline{\text{EN}}$) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock, therefore all associated specification limits are referenced to the negative edge of the clock input.

NOTE:

- 10EL circuits are designed to meet the DC specifications shown in the table after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse airflow greater than 500lfpm is maintained. Outputs are terminated through a 50Ω resistor to -2.0V except where otherwise specified on the individual data sheets.

NOTES:

1. This table replaces the three traditionally seen in ECL 100K data books. The same DC parameter values at $V_{EE} = -4.5\text{V}$ now apply across the full V_{EE} range of -4.2V to -5.5V . Outputs are terminated through a 50Ω resistor to -2.0V except where otherwise specified on the individual data sheets.
2. $V_{IN} = V_{IH}(\text{Max})$ or $V_{IL}(\text{Min})$.
3. $V_{IN} = V_{IH}(\text{Min})$ or $V_{IL}(\text{Max})$.
4. $V_{IN} = V_{IL}(\text{Max})$.
