

5V/3.3V 2.5Gbps HIGH-SPEED DIFFERENTIAL RECEIVER

SY88927V

FEATURES

- 3.3V and 5V power supply options
- Maximum frequency > 3.0GHz
- Internal 75K Ω input pull-down resistors
- Faster version of SY100EL16V
- 100K ECL compatible I/O
- Improved output waveform characteristics
- Available in 8-pin (3mm) MSOP and SOIC package

DESCRIPTION

The SY88927V is a 2.5Gbps high-speed differential receiver. The device is functionally equivalent to the EL16V devices, with higher performance capabilities. With output transition times significantly faster than the EL16V, the SY88927V is ideally suited for interfacing with high-frequency sources.

The SY88927V provides a V_{BB} output for either single-ended use or as a DC bias for AC coupling to the device. The V_{BB} pin should be used only as a bias for the SY88927V as its current sink/source capability is limited. Whenever used, the V_{BB} pin should be bypassed to ground via a 0.01 μ F capacitor.

Under open input conditions (pulled to V_{EE}), internal input clamps will force the Q output LOW.

PIN NAMES

Pin	Function
D	Data Inputs
Q	Data Outputs
V_{BB}	Reference Voltage Output

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Rating	Value	Unit
V_{EE}	Power Supply Voltage	–8.0 to 0	V
V_I	Input Voltage	0 to –6.0	V
I_{OUT}	Output Current –Continuous –Surge	50 100	mA
T_A	Operating Temperature Range	–40 to +85	°C
T_{store}	Storage Temperature Range	–65 to +150	°C

NOTE:

1. Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to ABSOLUTE MAXIMUM RATING conditions for extended periods may affect device reliability.

NOTES:

1. This table replaces the three tables traditionally seen in ECL 100K data books. Outputs are terminated through a 50 Ω resistor to –2.0V except where otherwise specified on the individual data sheets.
2. Guaranteed HIGH Signal for all inputs.
3. Guaranteed LOW Signal for all inputs.

NOTES:

1. Duty cycle skew is the difference between a t_{PLH} and t_{PHL} propagation delay through a device.
2. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{PP} min. and 1V. The lower end of the CMR range varies 1:1 with V_{EE} .
3. $V_{ID} > 150mV$.
