Attention please!

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies AG is an approved CECC manufacturer.

Packing

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

Components used in life-support devices or systems must be expressly authorized for such purpose!

Critical components¹ of the Infineon Technologies AG, may only be used in life-support devices or systems² with the express written approval of the Infineon Technologies AG.

¹ A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-

Product Info

General Description

The **TUA6024-2** is a 5 V mixer/oscillator and synthesizer for TV and VCR tuners.

Package

Features

General

- Suitable for analog tuners and for digital CATV tuners
- Compatible with TUA6024-S and TUA6024-K in normal mode
- New features in extended mode
- Full ESD protection

Mixer/Oscillator

- High impedance mixer input for LOW/MID band
- Low impedance mixer input for HIGH band
- 4 pin oscillator for LOW/MID band
- 4 pin oscillator for HIGH band

IF-Amplifier

- balanced SAW preamplifier
- Low output impedance

PLL

- PLL with short lock-in time
- High voltage VCO tuning output
- Fast I²C bus
- 3 NPN bandswitch buffers
- Internal LOW-MID/HIGH switch
- Lock-in flag
- Power-down reset
- 4 programmable reference divider ratios: 24, 64, 80, 128
- 4 programmable charge pump currents

Application

- The IC is suitable for PAL tuners in TV- and VCR-sets or CATV set-top receivers for analog TV and digital cable TV.

2.1 General Description

The **TUA6024-2** device combines a digitally programmable phase locked loop (PLL), with a mixer-oscillator block including two balanced mixers and oscillators for use in TV and VCR tuners.

The PLL block with four selectable chip addresses forms a digitally programmable phase locked loop. With a 4 MHz quartz crystal, the PLL permits precise setting of the frequency of the tuner oscillator up to 1024 MHz in increments of 31.25, 50, 62.5 or 166.7 kHz. The tuning process is controlled by a microprocessor via an I²C bus. The device has three output ports. A flag is set when the loop is locked. It can be read by the processor via the I²C bus.

The mixer-oscillator block includes two balanced mixers (one mixer with high-impedance input and one mixer with a balanced low-impedance input), two frequency and amplitude-stable balanced oscillators for LOW/MID and HIGH, an IF amplifier, a low-noise reference voltage source, and a band switch.

2.2 Features

General

- Suitable for analog tuners and for digital CATV tuners
- Compatible with TUA6024-S and TUA6024-K in normal mode
- New features in extended mode
- Full ESD protection

Mixer/Oscillator

- High impedance mixer input for LOW/MID band
- Low impedance mixer input for HIGH band
- 4 pin oscillator for LOW/MID band
- 4 pin oscillator for HIGH band

IF-Amplifier

- balanced SAW preamplifier
- Low output impedance

PLL

- PLL with short lock-in time
- High voltage VCO tuning output
- Fast I²C bus
- 3 NPN bandswitch buffers
- Internal LOW-MID/HIGH switch

- Lock-in flag
- Power-down reset
- 4 programmable reference divider ratios: 24, 64, 80, 128
- 4 programmable charge pump currents

2.3 Application

- The IC is suitable for PAL tuners in TV- and VCR-sets or CATV set-top receivers for analog TV and digital cable TV.

2.4 Package Outlines

P-TSSOP-28-1

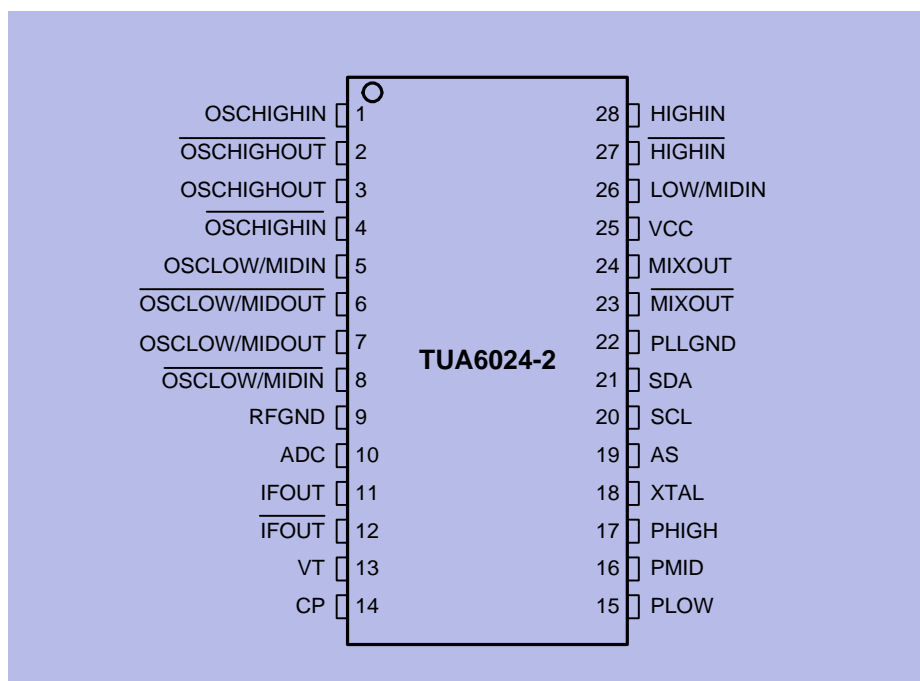

- 1) Does not include plastic or metal protrusion of 0.15 max. per side
 2) Does not include dambar protrusion

3.4 Circuit Description

3.4.1 General

In the **normal** mode (see Table 5-7 Test modes on page 31) the IC is compatible with TUA6024-S and TUA6024-K. An **extended** mode makes a reference divider ratio of 24 (see Table 5-8 Reference divider ratio on page 31) and two additional charge pump currents (see Table 5-9 Charge pump current on page 32) available.

3.4.2 Mixer-Oscillator block

The mixer oscillator section includes two balanced mixers (double balanced mixer), two balanced oscillators for LOW and / or MID band and HIGH band, an IF amplifier, a reference voltage source and a band switch.

Filters between tuner input and IC separate the TV frequency signals into two bands. The band switching in the tuner front-end is done by using two or three port outputs. In the selected band the signal passes a tuner input stage with MOSFET amplifier, a double-tuned bandpass filter and is then fed to the balanced mixer input of the IC which has in case of LOW / MID a high-impedance input and in case of HIGH a low-impedance input. The input signal is mixed there with the signal from the activated on chip oscillator to the IF frequency which is filtered out at the balanced high-impedance output pair by means of a parallel tuned circuit. The following SAW preamplifier has a low output impedance to drive the SAW filter directly.

3.4.3 PLL block

The oscillator signal is internally DC-coupled as a differential signal to the programmable divider inputs. The signal subsequently passes through a programmable divider with ratio $N = 256$ through 32767 and is then compared in a digital frequency / phase detector to a reference frequency $f_{ref} = 31.25, 50, 62.5$ or 166.7 kHz. This frequency is derived from an unbalanced, low-impedance 4 MHz crystal oscillator (pin XTAL) divided by $R = 128, 80, 64$ or 24.

The phase detector has two outputs that drive two current sources of opposite polarity as charge pump. If the negative edge of the divided VCO signal appears prior to the negative edge of the reference signal, the positive current source pulses for the duration of the phase difference. In the reverse case the negative current source pulses. If the two signals are in phase, the charge pump output (CP) goes into the high-impedance state (PLL is locked). An active low-pass filter integrates the current pulses to generate the tuning voltage for the VCO (internal amplifier, external pull-up resistor at TUNE and external RC circuitry). The charge pump output is also switched into the high-impedance state if the

control bits T0 = 1 and T1 = 0. Here it should be noted, however, that the tuning voltage can alter over a long period in the high-impedance state as a result of self-discharge in the peripheral circuitry. TUNE may be switched off by the control bit OS to allow external adjustments.

If the VCO is not oscillating the PLL locks to a tuning voltage of 33 V .

By means of the control bits CP, CM, T0 and T1 the pump current can be switched between four values by software. This programmability permits alteration of the control response time of the PLL in the locked-in state. In this way different VCO gains can be compensated, for example.

The software-switched ports PLOW, PMID and PHIGH are general-purpose open-collector outputs. The test bits T0 = 0 and T1 = 1 switches the test signals f_{ref} (i.e. $f_{XTAL} / 64$) and f_{div} (divided input signal) to PLOW and PMID respectively.

The lock detector resets the lock flag FL if the width of the charge pump current pulses is wider than the period of the crystal oscillator (i.e. 250 ns). Hence, if FL = 1, the maximum deviation of the input frequency from the programmed frequency is given by

$$\Delta f = \pm I_P (K_{VCO} / f_{XTAL}) (C1+C2) / (C1C2)$$

where I_P is the charge pump current, K_{VCO} the VCO gain, f_{XTAL} the crystal oscillator frequency and C1, C2 the capacitances in the loop filter (see [Figure 4-2 Evaluation Board, low phase noise application on page 20](#)). As the charge pump pulses at i.e. 62.5 kHz (= f_{ref}), it takes a maximum of 16 μ s for FL to be reset after the loop has lost lock state.

Once FL has been reset, it is set only if the charge pump pulse width is less than 250 ns for eight consecutive f_{ref} periods. Therefore it takes between 128 and 144 μ s for FL to be set after the loop regains lock.

3.4.4 I²C-Bus Interface

Data is exchanged between the processor and the PLL via the I²C bus. The clock is generated by the processor (input SCL), while pin SDA functions as an input or output depending on the direction of the data (open collector, external pull-up resistor). Both inputs have hysteresis and a low-pass characteristic, which enhance the noise immunity of the I²C bus.

The data from the processor pass through an I²C bus controller. Depending on their function the data are subsequently stored in registers. If the bus is free, both lines will be in the marking state (SDA, SCL are HIGH). Each telegram begins with the start condition and ends with the stop condition. Start condition: SDA goes LOW, while SCL remains HIGH. Stop condition: SDA goes HIGH while SCL remains HIGH. All further information transfer takes place during SCL = LOW, and the data is forwarded to the control logic on the positive clock edge.

The table "Bit Allocation" (see [Table 5-4 Bit Allocation Read / Write on page 30](#)) should be referred to the following description. All telegrams are transmitted byte-by-byte, followed by a ninth clock pulse, during which the control logic returns the SDA

line to LOW (acknowledge condition). The first byte is comprised of seven address bits. These are used by the processor to select the PLL from several peripheral components (chip select). The LSB bit (R/W) determines whether data are written into (R/W = 0) or read from (R/W = 1) the PLL.

In the data portion of the telegram during a WRITE operation, the MSB bit of the first or third data byte determines whether a divider ratio or control information is to follow. In each case the second byte of the same data type has to follow the first byte.

If the address byte indicates a READ operation, the PLL generates an acknowledge and then shifts out the status byte onto the SDA line. If the processor generates an acknowledge, a further status byte is output; otherwise the data line is released to allow the processor to generate a stop condition. The status word consists the lock flag and the power-on flag.

Four different chip addresses can be set by appropriate DC level at pin AS (see [Table 5-6 Address selection on page 31](#)).

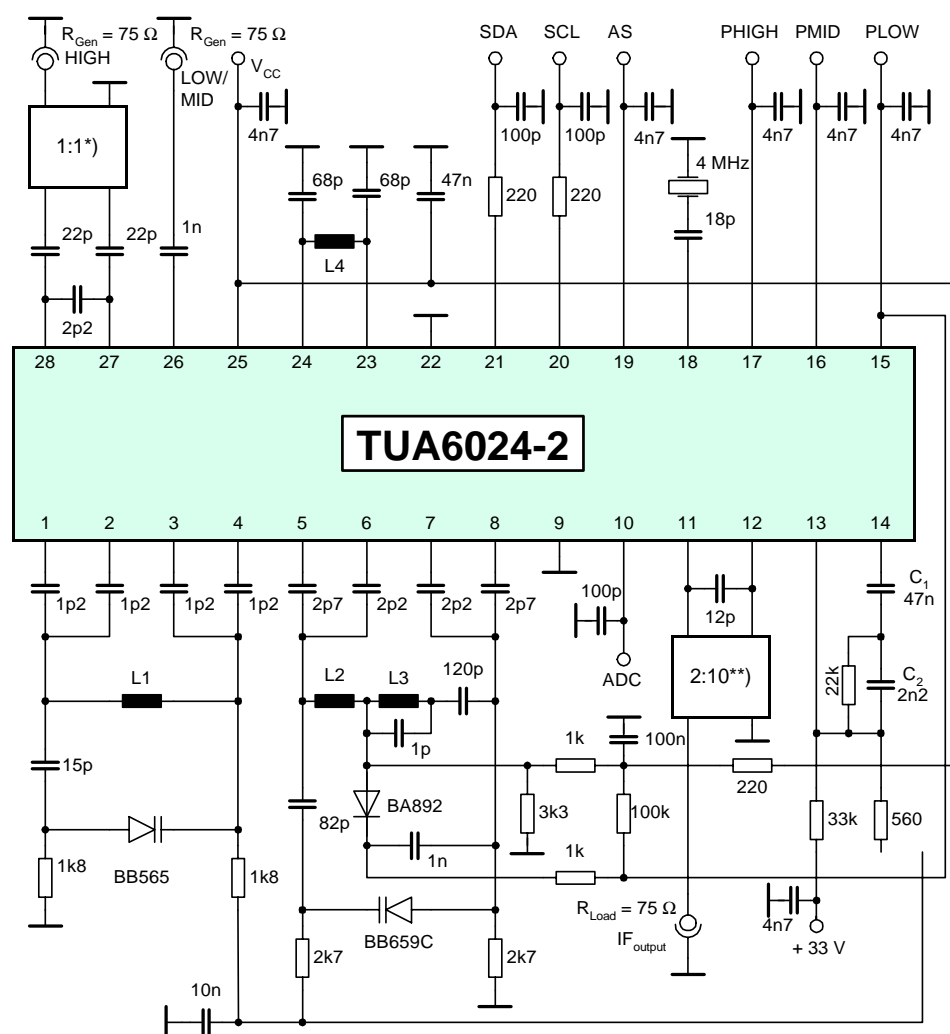

While applying the supply voltage, a power-on reset circuit prevents the PLL from setting the SDA line to LOW, which would block the bus. The power-on reset flag POR is set at power-on and when V_{CC} falls below 3.2 V. It will be reset at the end of a READ operation.

ESD-Protection ⁴⁾ .					
all pins	V _{ESD}		2	kV	

1). All values are referred to ground (pin), unless stated otherwise.

Currents with a positive sign flows into the pin and currents with a negative sign flows out of pin.

2). The maximum ambient temperature depends on the mounting conditions of the package. Any application mounting must guarantee not to exceed the maximum junction temperature of 125°C . As reference the temperature difference junction to case is given.

3). Referred to top center of package

4). According to EIA/JESD22-A114-B (HBM incircuit test), as a single device incircuit contact discharge test.

5.1.2 Operating Range

Within the operational range the IC operates as described in the circuit description. The AC / DC characteristic limits are not guaranteed.

Table 5-2 Operating Range						
Parameter	Symbol	Limit Values		Unit	Test Conditions	L Item
		min	max			
Supply voltage	V_{CC}	+4.5	+5.5	V		
Programmable divider factor	N	256	32767			
LOW/MID Mixer input frequency range	f_i	30	500	MHz		
HIGH Mixer input frequency range	f_i	400	900	MHz

	L _{IF}		10		nH			
Rejection at the IF outputs								
Divider interference level ^{2.)}	V _o			30	dBμV			
Channel S02 beat rejection ^{3.)}	a	66			dBc	f _{RF} = 76.25 MHz P _{RF} = 80 dBμV		

■ This value is only guaranteed in lab.

- 1). Measured in the evaluation board (see Chapter 4), worst case in band.
- 2). This is the level of divider interferences close to the IF frequency. For example channel S3: $f_{OSC} = 158.15\text{ MHz}$, $1/4 f_{OSC} = 39.5375\text{ MHz}$. Divider interference is measured in the evaluation board (see Chapter 4).
- 3). Channel S02 beat is the interfering product of f_{RF} , f_{IF} and f_{OSC} of channel S02, $f_{beat} = 37.35\text{ MHz}$. The possible mechanisms are $f_{OSC} - 2 \times f_{IF}$ or $2 \times f_{RFpix} - f_{OSC}$. Measured in the evaluation board (see Chapter 4).

5.4 Test Circuits

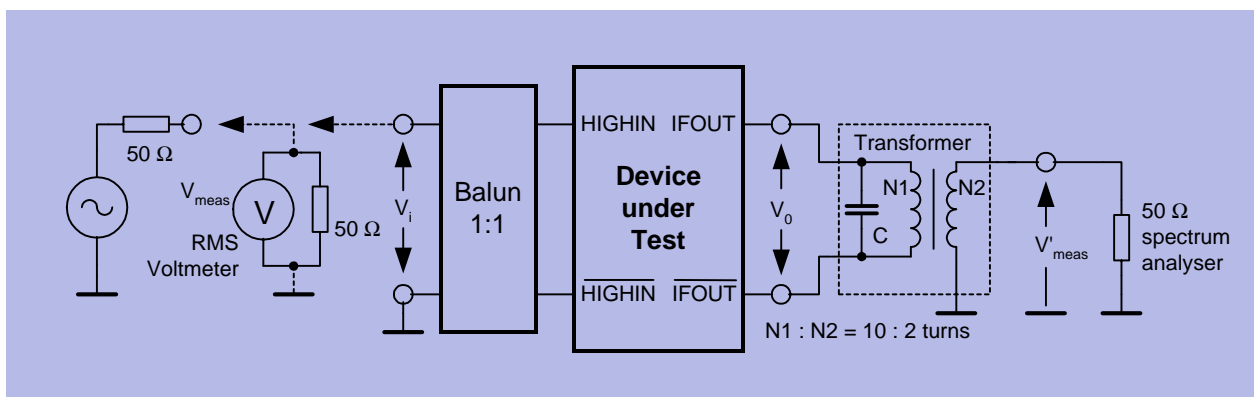

5.4.1 Gain (G_V) test Set-up in LOW/MID

GVHF2

- $Z_i \gg 50 \Omega \Rightarrow V_i = 2 \times V_{\text{meas}} = 80 \text{ dB}\mu\text{V}$
- $V_i = V_{\text{meas}} + 6\text{dB} = 80 \text{ dB}\mu\text{V}$
- $V_0 = V'_{\text{meas}} + 16 \text{ dB}$ (transformer ratio N1:N2 and transformer loss)
- $G_V = 20 \log(V_0 / V_i)$

5.4.2 Gain (G_V) test Set-up in HIGH

GVHF2

- $V_i = V_{\text{meas}} = 70 \text{ dB}\mu\text{V}$
- $V_0 = V'_{\text{meas}} + 16 \text{ dB}$ (transformer ratio N1:N2 and transformer loss)
- $G_V = 20 \log(V_0 / V_i) + 1 \text{ dB}$ (1 dB = insertion loss of balun)

5.4.3 Matching circuit for optimum noise figure in LOW/MID

NFM

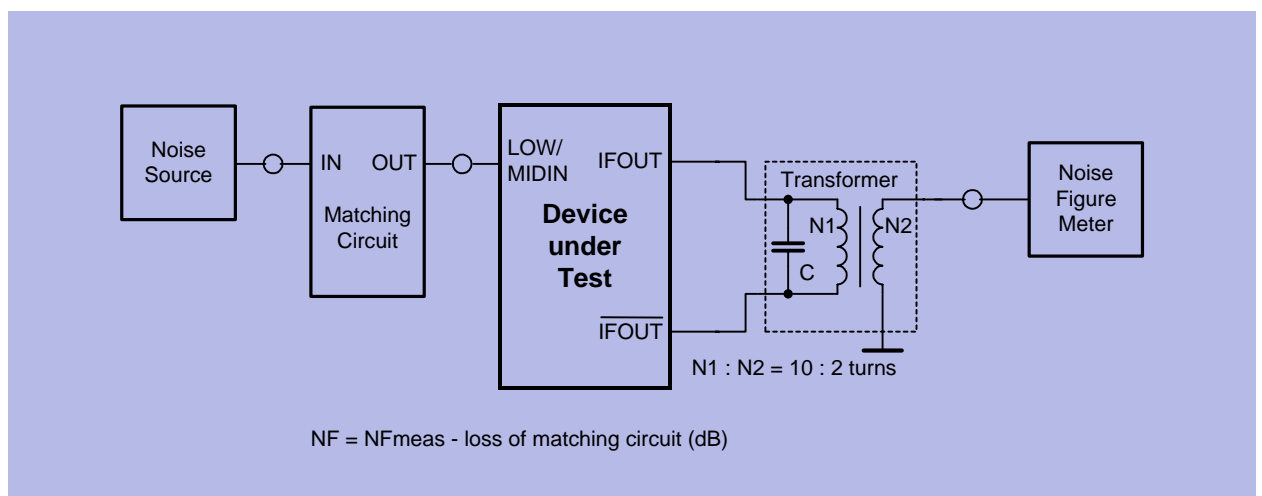

For $f_{RF} = 50$ MHz

- loss = 0 dB
- image suppression = 16 dB

For $f_{RF} = 150$ MHz

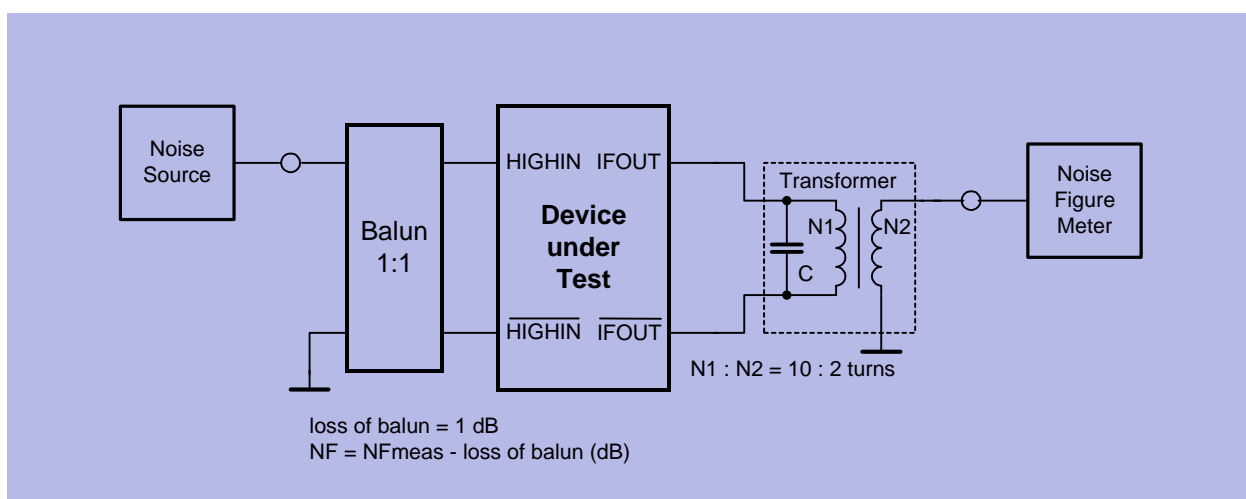

- loss = 1.3 dB
- image suppression = 13 dB

5.4.4 Noise Figure Test Set-up in LOW/MID

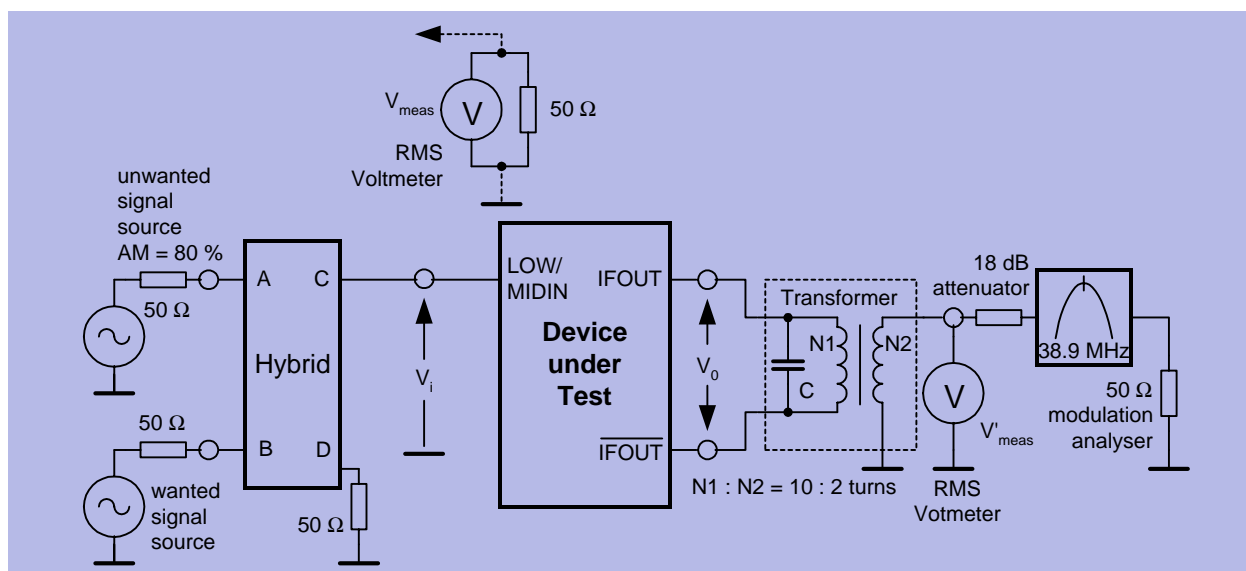

NFVHF2

5.4.5 Noise Figure Test Set-up in HIGH

NFUHF2

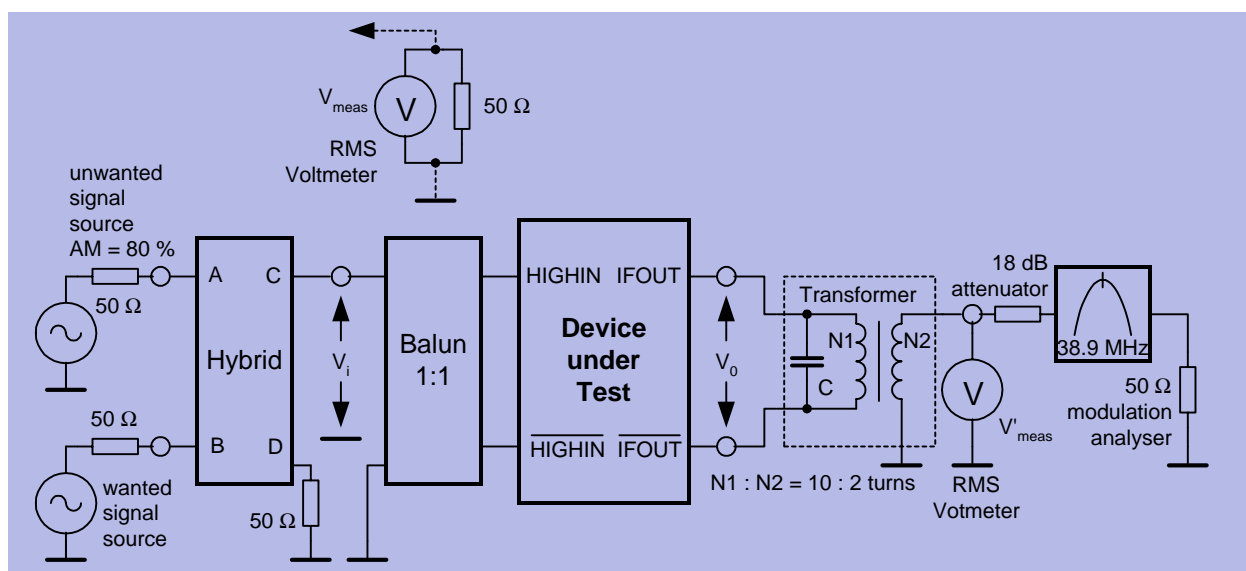

5.4.6 Cross modulation Test Set-up in LOW/MID band

XVHF2

- $Z_i \gg 50 \Omega \Rightarrow V_i = 2 \times V_{meas}$
- $V'_{meas} = V_0 - 16 \text{ dB}$ (transformer ratio N1:N2 and transformer loss)
- wanted output signal at f_{pix} , $V_0 = 100 \text{ dB}\mu\text{V}$
- unwanted output signal at f_{snd} , 80 % AM modulated with 1 kHz

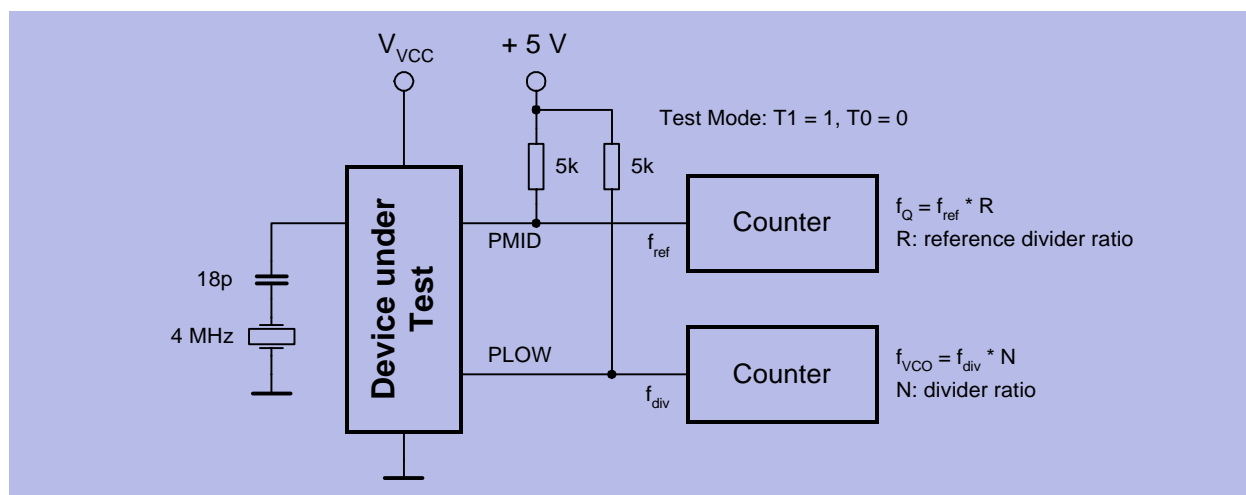

5.4.7 Cross modulation Test Set-up in HIGH band

XUHF2

- $V'_{\text{meas}} = V_0 - 16 \text{ dB}$ (transformer ratio $N_1:N_2$ and transformer loss)
- wanted output signal at f_{pix} , $V_0 = 100 \text{ dB}\mu\text{V}$
- unwanted output signal at f_{snd} , 80 % AM modulated with 1 kHz

5.4.8 Measurement of f_{ref} and f_{div}

freq_meas_cof

5.5 Electrical Diagrams

5.5.1 Input admittance (S11) of the LOW/MID band mixer input

$Y_0 = 20\text{mS}$ (single ended)

5.5.2 Input impedance (S11) of the HIGH band mixer input

$Z_0 = 50\ \Omega$ (balanced)

5.5.3 Output admittance (S22) of the Mixer output

$Y_0 = 20\text{mS}$ (balanced)

5.5.4 Output impedance (S22) of the IF output

$Z_0 = 50\ \Omega$ (single/ double ended)
