Notes on Electrical Characteristics:

[1] Guaranteed by design and characterization, not 100% tested in production.

[2] Slew rate measured through Vswing centered around differential zero

[3] Vxabs is defined as the voltage where CLK = CLK#

[4] Only applies to the differential rising edge (CLK rising and CLK# falling)

[5] Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#.

[6] All Long Term Accuracy and Clock Period specifications are guaranteed assuming that REF is at 14.31818MHz

[7] Operation under these conditions is neither implied, nor guaranteed.
